WO 02/34771 A2

(54) Title: NUCLEIC ACIDS AND PROTEINS FROM STREPTOCOCCUS GROUPS A & B

(57) Abstract: The invention provides proteins from group B streptococcus (*Streptococcus agalactiae*) and group A streptococcus (*Streptococcus pyogenes*), including amino acid sequences and the corresponding nucleotide sequences. Data are given to show that the proteins are useful antigens for vaccines, immunogenic compositions, and/or diagnostics. The proteins are also targets for antibiotics.

NUCLEIC ACIDS AND PROTEINS FROM STREPTOCOCCUS GROUPS A & B

All documents cited herein are incorporated by reference in their entirety.

TECHNICAL FIELD

This invention relates to nucleic acid and proteins from the bacteria *Streptococcus agalactiae* (GBS) and *Streptococcus pyogenes* (GAS).

BACKGROUND ART

Once thought to infect only cows, the Gram-positive bacterium *Streptococcus agalactiae* (or "group B streptococcus", abbreviated to "GBS") is now known to cause serious disease, bacteremia and meningitis, in immunocompromised individuals and in neonates. There are two types of neonatal infection. The first (early onset, usually within 5 days of birth) is manifested by bacteremia and pneumonia. It is contracted vertically as a baby passes through the birth canal. GBS colonises the vagina of about 25% of young women, and approximately 1% of infants born via a vaginal birth to colonised mothers will become infected. Mortality is between 50-70%. The second is a meningitis that occurs 10 to 60 days after birth. If pregnant women are vaccinated with type III capsule so that the infants are passively immunised, the incidence of the late onset meningitis is reduced but is not entirely eliminated.

The "B" in "GBS" refers to the Lancefield classification, which is based on the antigenicity of a carbohydrate which is soluble in dilute acid and called the C carbohydrate. Lancefield identified 13 types of C carbohydrate, designated A to O, that could be serologically differentiated. The organisms that most commonly infect humans are found in groups A, B, D, and G. Within group B, strains can be divided into 8 serotypes (Ia, Ib, Ia/c, II, III, IV, V, and VI) based on the structure of their polysaccharide capsule.

Group A streptococcus ("GAS", *S.pyogenes*) is a frequent human pathogen, estimated to be present in between 5-15% of normal individuals without signs of disease. When host defences are compromised, or when the organism is able to exert its virulence, or when it is introduced to vulnerable tissues or hosts, however, an acute infection occurs. Diseases include puerperal fever, scarlet fever, erysipelas, pharyngitis, impetigo, necrotising fasciitis, myositis and streptococcal toxic shock syndrome.

S.pyogenes is typically treated using antibiotics. Although *S.agalactiae* is inhibited by antibiotics, however, it is not killed by penicillin as easily as GAS. Prophylactic vaccination is thus preferable.

Current GBS vaccines are based on polysaccharide antigens, although these suffer from poor immunogenicity. Anti-idiotypic approaches have also been used (*e.g.* WO99/54457). There remains a need, however, for effective adult vaccines against *S.agalactiae* infection. There also remains a need for vaccines against *S.pyogenes* infection.

It is an object of the invention to provide proteins which can be used in the development of such vaccines. The proteins may also be useful for diagnostic purposes, and as targets for antibiotics.

DISCLOSURE OF THE INVENTION

The invention provides proteins comprising the *S.agalactiae* amino acid sequences disclosed in the examples, and proteins comprising the *S.pyogenes* amino acid sequences disclosed in the examples. These amino acid sequences are the even SEQ IDs between 1 and 10960.

It also provides proteins comprising amino acid sequences having sequence identity to the *S.agalactiae* amino acid sequences disclosed in the examples, and proteins comprising amino acid sequences having sequence identity to the *S.pyogenes* amino acid sequences disclosed in the examples. Depending on the particular sequence, the degree of sequence identity is preferably greater than 50% (*e.g.* 60%, 70%, 80%, 90%, 95%, 99% or more). These proteins include homologs, orthologs, allelic variants and functional mutants. Typically, 50% identity or more between two proteins is considered to be an indication of functional equivalence. Identity between proteins is preferably determined by the Smith-Waterman homology search algorithm as implemented in the MPSRCH program (Oxford Molecular), using an affine gap search with parameters *gap open penalty=12* and *gap extension penalty=1*.

Preferred proteins of the invention are GBS1 to GBS689 (see Table IV).

The invention further provides proteins comprising fragments of the *S.agalactiae* amino acid sequences disclosed in the examples, and proteins comprising fragments of the *S.pyogenes* amino acid sequences disclosed in the examples. The fragments should comprise at least *n* consecutive amino acids from the sequences and, depending on the particular sequence, *n* is 7 or more (*e.g.* 8, 10, 12, 14, 16, 18, 20, 30, 40, 50, 60, 70, 80, 90, 100 or more). Preferably the fragments comprise one or more epitopes from the sequence. Other preferred fragments are (a) the N-terminal signal peptides of the proteins disclosed in the examples, (b) the proteins disclosed in the examples, but without their N-terminal signal peptides, (c) fragments common to the related GAS and GBS proteins disclosed in the examples, and (d) the proteins disclosed in the examples, but without their N-terminal amino acid residue.

The proteins of the invention can, of course, be prepared by various means (*e.g.* recombinant expression, purification from GAS or GBS, chemical synthesis *etc.*) and in various forms (*e.g.* native, fusions, glycosylated, non-glycosylated *etc.*). They are preferably prepared in substantially pure form (*i.e.* substantially free from other streptococcal or host cell proteins) or substantially isolated form. Proteins of the invention are preferably streptococcal proteins.

According to a further aspect, the invention provides antibodies which bind to these proteins. These may be polyclonal or monoclonal and may be produced by any suitable means (*e.g.* by recombinant expression). To increase compatibility with the human immune system, the antibodies may be chimeric or humanised (*e.g.* Breedveld (2000) *Lancet* 355(9205):735-740; Gorman & Clark (1990) *Semin. Immunol.* 2:457-466), or fully human antibodies may be used. The antibodies may include a detectable label (*e.g.* for diagnostic assays).

According to a further aspect, the invention provides nucleic acid comprising the *S.agalactiae* nucleotide sequences disclosed in the examples, and nucleic acid comprising the *S.pyogenes* nucleotide sequences disclosed in the examples. These nucleic acid sequences are the odd SEQ IDs between 1 and 10966.

In addition, the invention provides nucleic acid comprising nucleotide sequences having sequence identity to the *S.agalactiae* nucleotide sequences disclosed in the examples, and nucleic acid comprising nucleotide sequences having sequence identity to the *S.pyogenes* nucleotide sequences disclosed in the examples. Identity between sequences is preferably determined by the Smith-Waterman homology search algorithm as described above.

Furthermore, the invention provides nucleic acid which can hybridise to the *S.agalactiae* nucleic acid disclosed in the examples, and nucleic acid which can hybridise to the *S.pyogenes* nucleic acid disclosed in the examples preferably under 'high stringency' conditions (*e.g.* 65°C in 0.1xSSC, 0.5% SDS solution).

Nucleic acid comprising fragments of these sequences are also provided. These should comprise at least *n* consecutive nucleotides from the *S.agalactiae* or *S.pyogenes* sequences and, depending on the particular sequence, *n* is 10 or more (*e.g.* 12, 14, 15, 18, 20, 25, 30, 35, 40, 50, 60, 70, 80, 90, 100, 150, 200 or more). The fragments may comprise sequences which are common to the related GAS and GBS sequences disclosed in the examples.

According to a further aspect, the invention provides nucleic acid encoding the proteins and protein fragments of the invention.

The invention also provides: nucleic acid comprising nucleotide sequence SEQ ID 10967; nucleic acid comprising nucleotide sequences having sequence identity to SEQ ID 10967; nucleic acid which can hybridise to SEQ ID 10967 (preferably under 'high stringency' conditions); nucleic acid comprising a fragment of at least *n* consecutive nucleotides from SEQ ID 10967, wherein *n* is 10 or more *e.g.* 12, 14, 15, 18, 20, 25, 30, 35, 40, 50, 60, 70, 80, 90, 100, 150, 200, 250, 300, 350, 400, 450, 500, 600, 700, 800, 900, 1000, 1500, 2000, 3000, 4000, 5000, 10000, 100000, 1000000 or more

Nucleic acids of the invention can be used in hybridisation reactions (*e.g.* Northern or Southern blots, or in nucleic acid microarrays or 'gene chips') and amplification reactions (*e.g.* PCR, SDA, SSSR, LCR, TMA, NASBA *etc.*) and other nucleic acid techniques.

It should also be appreciated that the invention provides nucleic acid comprising sequences complementary to those described above (*e.g.* for antisense or probing, or for use as primers).

Nucleic acid according to the invention can, of course, be prepared in many ways (*e.g.* by chemical synthesis, from genomic or cDNA libraries, from the organism itself *etc.*) and can take various forms (*e.g.* single stranded, double stranded, vectors, primers, probes, labelled *etc.*). The nucleic acid is preferably in substantially isolated form.

Nucleic acid according to the invention may be labelled *e.g.* with a radioactive or fluorescent label. This is particularly useful where the nucleic acid is to be used in nucleic acid detection techniques *e.g.* where the nucleic acid is a primer or as a probe for use in techniques such as PCR, LCR, TMA, NASBA *etc.*

In addition, the term "nucleic acid" includes DNA and RNA, and also their analogues, such as those containing modified backbones, and also peptide nucleic acids (PNA) *etc.*

According to a further aspect, the invention provides vectors comprising nucleotide sequences of the invention (*e.g.* cloning or expression vectors) and host cells transformed with such vectors.

According to a further aspect, the invention provides compositions comprising protein, antibody, and/or nucleic acid according to the invention. These compositions may be suitable as immunogenic compositions, for instance, or as diagnostic reagents, or as vaccines.

The invention also provides nucleic acid, protein, or antibody according to the invention for use as medicaments (*e.g.* as immunogenic compositions or as vaccines) or as diagnostic reagents. It also provides the use of nucleic acid, protein, or antibody according to the invention in the manufacture of: (i) a medicament for treating or preventing disease and/or infection caused by streptococcus; (ii) a diagnostic reagent for detecting the presence of streptococcus or of antibodies raised against streptococcus; and/or (iii) a reagent which can raise antibodies against streptococcus. Said streptococcus may be any species, group or strain, but is preferably *S.agalactiae*, especially serotype III or V, or *S.pyogenes*. Said disease may be bacteremia, meningitis, puerperal fever, scarlet fever, erysipelas, pharyngitis, impetigo, necrotising fasciitis, myositis or toxic shock syndrome.

The invention also provides a method of treating a patient, comprising administering to the patient a therapeutically effective amount of nucleic acid, protein, and/or antibody of the invention. The patient may either be at risk from the disease themselves or may be a pregnant woman ('maternal immunisation' *e.g.* Glezen & Alpers (1999) *Clin. Infect. Dis.* 28:219-224).

Administration of protein antigens is a preferred method of treatment for inducing immunity.

Administration of antibodies of the invention is another preferred method of treatment. This method of passive immunisation is particularly useful for newborn children or for pregnant women. This method will typically use monoclonal antibodies, which will be humanised or fully human.

The invention also provides a kit comprising primers (*e.g.* PCR primers) for amplifying a template sequence contained within a *Streptococcus* (*e.g. S.pyogenes* or *S.agalactiae*) nucleic acid sequence, the kit comprising a first primer and a second primer, wherein the first primer is substantially complementary to said template sequence and the second primer is substantially complementary to a complement of said template sequence, wherein the parts of said primers which have substantial complementarity define the termini of the template sequence to be amplified. The first primer and/or the second primer may include a detectable label (*e.g.* a fluorescent label).

The invention also provides a kit comprising first and second single-stranded oligonucleotides which allow amplification of a *Streptococcus* template nucleic acid sequence contained in a single- or double-stranded nucleic acid (or mixture thereof), wherein: (a) the first oligonucleotide comprises a primer sequence which is substantially complementary to said template nucleic acid sequence; (b) the second oligonucleotide comprises a primer sequence which is substantially complementary to the complement of said template nucleic acid sequence; (c) the first oligonucleotide and/or the second oligonucleotide comprise(s) sequence which is not compementary to said template nucleic acid; and (d) said primer sequences define the termini of the template sequence to be amplified. The non-complementary sequence(s) of feature (c) are preferably upstream of (*i.e.* 5' to) the primer sequences. One or both of these (c) sequences may comprise a restriction site (*e.g.* EP-B-0509612) or a promoter sequence (*e.g.* EP-B-0505012). The first oligonucleotide and/or the second oligonucleotide may include a detectable label (*e.g.* a fluorescent label).

The template sequence may be any part of a genome sequence (*e.g.* SEQ ID 10967). For example, it could be a rRNA gene (*e.g.* Turenne *et al.* (2000) *J. Clin. Microbiol.* 38:513-520; SEQ IDs 12018-12024 herein) or a protein-coding gene. The template sequence is preferably specific to GBS.

The invention also provides a computer-readable medium (*e.g.* a floppy disk, a hard disk, a CD-ROM, a DVD *etc.*) and/or a computer database containing one or more of the sequences in the sequence listing. The medium preferably contains SEQ ID 10967.

The invention also provides a hybrid protein represented by the formula NH_2-A-[-X-L-]$_n$-B-COOH, wherein X is a protein of the invention, L is an optional linker amino acid sequence, A is an optional N-terminal amino acid sequence, B is an optional C-terminal amino acid sequence, and n is an integer greater than 1. The value of n is between 2 and x, and the value of x is typically 3, 4, 5, 6, 7, 8, 9 or 10. Preferably n is 2, 3 or 4; it is more preferably 2 or 3; most preferably, $n = 2$. For each n instances, -X- may be the same or different. For each n instances of [-X-L-], linker amino acid sequence -L- may be present or absent. For instance, when n=2 the hybrid may be NH_2-X_1-L_1-X_2-L_2-COOH, NH_2-X_1-X_2-COOH, NH_2-X_1-L_1-X_2-COOH, NH_2-X_1-X_2-L_2-COOH, *etc.* Linker amino acid sequence(s) -L- will typically be short (*e.g.* 20 or fewer amino acids *i.e.* 19, 18, 17, 16, 15, 14, 13, 12, 11, 10, 9, 8, 7, 6, 5, 4, 3, 2, 1). Examples include short peptide sequences which facilitate cloning, poly-glycine linkers (*i.e.* Gly_n where n = 2, 3, 4, 5, 6, 7, 8, 9, 10 or more), and histidine tags (*i.e.* His_n where n = 3, 4, 5, 6, 7, 8, 9, 10 or more). Other suitable linker amino acid sequences will be apparent to those skilled in the art. -A- and -B- are optional sequences which will typically be short (*e.g.* 40 or fewer amino acids *i.e.* 39, 38, 37, 36, 35, 34, 33, 32, 31, 30, 29, 28, 27, 26, 25, 24, 23, 22, 21, 20, 19, 18, 17, 16, 15, 14, 13, 12, 11, 10, 9, 8, 7, 6, 5, 4, 3, 2, 1). Examples include leader sequences to direct protein trafficking, or short peptide sequences which facilitate cloning or purification (*e.g.* histidine tags *i.e.* His_n where n = 3, 4, 5, 6, 7, 8, 9, 10 or more). Other suitable N-terminal and C-terminal amino acid sequences will be apparent to those

skilled in the art. In some embodiments, each X will be a GBS sequence; in others, mixtures of GAS and GBS will be used.

According to further aspects, the invention provides various processes.

A process for producing proteins of the invention is provided, comprising the step of culturing a host cell of to the invention under conditions which induce protein expression.

A process for producing protein or nucleic acid of the invention is provided, wherein the protein or nucleic acid is synthesised in part or in whole using chemical means.

A process for detecting polynucleotides of the invention is provided, comprising the steps of: (a) contacting a nucleic probe according to the invention with a biological sample under hybridising conditions to form duplexes; and (b) detecting said duplexes.

A process for detecting *Streptococcus* in a biological sample (*e.g.* blood) is also provided, comprising the step of contacting nucleic acid according to the invention with the biological sample under hybridising conditions. The process may involve nucleic acid amplification (*e.g.* PCR, SDA, SSSR, LCR, TMA, NASBA *etc.*) or hybridisation (*e.g.* microarrays, blots, hybridisation with a probe in solution *etc.*). PCR detection of *Streptococcus* in clinical samples, in particular *S.pyogenes*, has been reported [see *e.g.* Louie *et al.* (2000) *CMAJ* 163:301-309; Louie *et al.* (1998) *J. Clin. Microbiol.* 36:1769-1771]. Clinical assays based on nucleic acid are described in general in Tang *et al.* (1997) *Clin. Chem.* 43:2021-2038.

A process for detecting proteins of the invention is provided, comprising the steps of: (a) contacting an antibody of the invention with a biological sample under conditions suitable for the formation of an antibody-antigen complexes; and (b) detecting said complexes.

A process for identifying an amino acid sequence is provided, comprising the step of searching for putative open reading frames or protein-coding regions within a genome sequence of *S.agalactiae*. This will typically involve *in silico* searching the sequence for an initiation codon and for an in-frame termination codon in the downstream sequence. The region between these initiation and termination codons is a putative protein-coding sequence. Typically, all six possible reading frames will be searched. Suitable software for such analysis includes ORFFINDER (NCBI), GENEMARK [Borodovsky & McIninch (1993) *Computers Chem.* 17:122-133), GLIMMER [Salzberg *et al.* (1998) *Nucleic Acids Res.* 26:544-548; Salzberg *et al.* (1999) *Genomics* 59:24-31; Delcher *et al.* (1999) *Nucleic Acids Res.* 27:4636-4641], or other software which uses Markov models [*e.g.* Shmatkov *et al.* (1999) *Bioinformatics* 15:874-876]. The invention also provides a protein comprising the identified amino acid sequence. These proteins can then expressed using conventional techniques.

The invention also provides a process for determining whether a test compound binds to a protein of the invention. If a test compound binds to a protein of the invention and this binding inhibits the life cycle of the GBS bacterium, then the test compound can be used as an antibiotic or as a lead compound for the

design of antibiotics. The process will typically comprise the steps of contacting a test compound with a protein of the invention, and determining whether the test compound binds to said protein. Preferred proteins of the invention for use in these processes are enzymes (*e.g.* tRNA synthetases), membrane transporters and ribosomal proteins. Suitable test compounds include proteins, polypeptides, carbohydrates, lipids, nucleic acids (*e.g.* DNA, RNA, and modified forms thereof), as well as small organic compounds (*e.g.* MW between 200 and 2000 Da). The test compounds may be provided individually, but will typically be part of a library (*e.g.* a combinatorial library). Methods for detecting a binding interaction include NMR, filter-binding assays, gel-retardation assays, displacement assays, surface plasmon resonance, reverse two-hybrid *etc.* A compound which binds to a protein of the invention can be tested for antibiotic activity by contacting the compound with GBS bacteria and then monitoring for inhibition of growth. The invention also provides a compound identified using these methods.

The invention also provides a composition comprising a protein or the invention and one or more of the following antigens:

- a protein antigen from *Helicobacter pylori* such as VacA, CagA, NAP, HopX, HopY [*e.g.* WO98/04702] and/or urease.
- a protein antigen from *N.meningitidis* serogroup B, such as those in WO99/24578, WO99/36544, WO99/57280, WO00/22430, Tettelin *et al.* (2000) *Science* 287:1809-1815, Pizza *et al.* (2000) *Science* 287:1816-1820 and WO96/29412, with protein '287' and derivatives being particularly preferred.
- an outer-membrane vesicle (OMV) preparation from *N.meningitidis* serogroup B, such as those disclosed in WO01/52885; Bjune *et al.* (1991) *Lancet* 338(8775):1093-1096; Fukasawa *et al.* (1999) *Vaccine* 17:2951-2958; Rosenqvist *et al.* (1998) *Dev. Biol. Stand.* 92:323-333 *etc.*
- a saccharide antigen from *N.meningitidis* serogroup A, C, W135 and/or Y, such as the oligosaccharide disclosed in Costantino *et al.* (1992) *Vaccine* 10:691-698from serogroup C [see also Costantino *et al.* (1999) *Vaccine* 17:1251-1263].
- a saccharide antigen from *Streptococcus pneumoniae* [*e.g.* Watson (2000) *Pediatr Infect Dis J* 19:331-332; Rubin (2000) *Pediatr Clin North Am* 47:269-285, v; Jedrzejas (2001) *Microbiol Mol Biol Rev* 65:187-207].
- an antigen from hepatitis A virus, such as inactivated virus [*e.g.* Bell (2000) *Pediatr Infect Dis J* 19:1187-1188; Iwarson (1995) *APMIS* 103:321-326].
- an antigen from hepatitis B virus, such as the surface and/or core antigens [*e.g.* Gerlich *et al.* (1990) *Vaccine* 8 Suppl:S63-68 & 79-80].
- an antigen from hepatitis C virus [*e.g.* Hsu *et al.* (1999) *Clin Liver Dis* 3:901-915].
- an antigen from *Bordetella pertussis*, such as pertussis holotoxin (PT) and filamentous haemagglutinin (FHA) from *B.pertussis*, optionally also in combination with pertactin and/or

agglutinogens 2 and 3 [*e.g.* Gustafsson *et al.* (1996) *N. Engl. J. Med.* 334:349-355; Rappuoli *et al.* (1991) *TIBTECH* 9:232-238].

- a diphtheria antigen, such as a diphtheria toxoid [*e.g.* chapter 3 of *Vaccines* (1988) eds. Plotkin & Mortimer. ISBN 0-7216-1946-0] *e.g.* the CRM_{197} mutant [*e.g.* Del Guidice *et al.* (1998) *Molecular Aspects of Medicine* 19:1-70].
- a tetanus antigen, such as a tetanus toxoid [*e.g.* chapter 4 of Plotkin & Mortimer].
- a saccharide antigen from *Haemophilus influenzae* B.
- an antigen from *N.gonorrhoeae* [*e.g.* WO99/24578, WO99/36544, WO99/57280].
- an antigen from *Chlamydia pneumoniae* [*e.g.* PCT/IB01/01445; Kalman *et al.* (1999) *Nature Genetics* 21:385-389; Read *et al.* (2000) *Nucleic Acids Res* 28:1397-406; Shirai *et al.* (2000) *J. Infect. Dis.* 181(Suppl 3):S524-S527; WO99/27105; WO00/27994; WO00/37494].
- an antigen from *Chlamydia trachomatis* [*e.g.* WO99/28475].
- an antigen from *Porphyromonas gingivalis* [*e.g.* Ross *et al.* (2001) *Vaccine* 19:4135-4142].
- polio antigen(s) [*e.g.* Sutter *et al.* (2000) *Pediatr Clin North Am* 47:287-308; Zimmerman & Spann (1999) *Am Fam Physician* 59:113-118, 125-126] such as IPV or OPV.
- rabies antigen(s) [*e.g.* Dreesen (1997) *Vaccine* 15 Suppl:S2-6] such as lyophilised inactivated virus [*e.g. MMWR Morb Mortal Wkly Rep* 1998 Jan 16;47(1):12, 19; RabAvert™].
- measles, mumps and/or rubella antigens [*e.g.* chapters 9, 10 & 11 of Plotkin & Mortimer].
- influenza antigen(s) [*e.g.* chapter 19 of Plotkin & Mortimer], such as the haemagglutinin and/or neuraminidase surface proteins.
- an antigen from *Moraxella catarrhalis* [*e.g.* McMichael (2000) *Vaccine* 19 Suppl 1:S101-107].
- an antigen from *Staphylococcus aureus* [*e.g.* Kuroda *et al.* (2001) *Lancet* 357(9264):1225-1240; see also pages 1218-1219].

Where a saccharide or carbohydrate antigen is included, it is preferably conjugated to a carrier protein in order to enhance immunogenicity [*e.g.* Ramsay *et al.* (2001) *Lancet* 357(9251):195-196; Lindberg (1999) *Vaccine* 17 Suppl 2:S28-36; *Conjugate Vaccines* (eds. Cruse *et al.*) ISBN 3805549326, particularly vol. 10:48-114 *etc.*]. Preferred carrier proteins are bacterial toxins or toxoids, such as diphtheria or tetanus toxoids. The CRM_{197} diphtheria toxoid is particularly preferred. Other suitable carrier proteins include the *N.meningitidis* outer membrane protein [*e.g.* EP-0372501], synthetic peptides [*e.g.* EP-0378881, EP-0427347], heat shock proteins [*e.g.* WO93/17712], pertussis proteins [*e.g.* WO98/58668; EP-0471177], protein D from *H.influenzae* [*e.g.* WO00/56360], toxin A or B from *C.difficile* [*e.g.* WO00/61761], *etc.* Any suitable conjugation reaction can be used, with any suitable linker where necessary.

Toxic protein antigens may be detoxified where necessary (*e.g.* detoxification of pertussis toxin by chemical and/or genetic means).

Where a diphtheria antigen is included in the composition it is preferred also to include tetanus antigen and pertussis antigens. Similarly, where a tetanus antigen is included it is preferred also to include diphtheria and pertussis antigens. Similarly, where a pertussis antigen is included it is preferred also to include diphtheria and tetanus antigens.

Antigens are preferably adsorbed to an aluminium salt.

Antigens in the composition will typically be present at a concentration of at least 1μg/ml each. In general, the concentration of any given antigen will be sufficient to elicit an immune response against that antigen.

The invention also provides compositions comprising two or more proteins of the present invention. The two or more proteins may comprise GBS sequences or may comprise GAS and GBS sequences.

A summary of standard techniques and procedures which may be employed to perform the invention (*e.g.* to utilise the disclosed sequences for vaccination or diagnostic purposes) follows. This summary is not a limitation on the invention but, rather, gives examples that may be used, but are not required.

General

The practice of the present invention will employ, unless otherwise indicated, conventional techniques of molecular biology, microbiology, recombinant DNA, and immunology, which are within the skill of the art. Such techniques are explained fully in the literature *eg.* Sambrook *Molecular Cloning; A Laboratory Manual, Second Edition* (1989); *DNA Cloning, Volumes I and II* (D.N Glover ed. 1985); *Oligonucleotide Synthesis* (M.J. Gait ed, 1984); *Nucleic Acid Hybridization* (B.D. Hames & S.J. Higgins eds. 1984); *Transcription and Translation* (B.D. Hames & S.J. Higgins eds. 1984); *Animal Cell Culture* (R.I. Freshney ed. 1986); *Immobilized Cells and Enzymes* (IRL Press, 1986); B. Perbal, *A Practical Guide to Molecular Cloning* (1984); the *Methods in Enzymology* series (Academic Press, Inc.), especially volumes 154 & 155; *Gene Transfer Vectors for Mammalian Cells* (J.H. Miller and M.P. Calos eds. 1987, Cold Spring Harbor Laboratory); Mayer and Walker, eds. (1987), *Immunochemical Methods in Cell and Molecular Biology* (Academic Press, London); Scopes, (1987) *Protein Purification: Principles and Practice*, Second Edition (Springer-Verlag, N.Y.), and *Handbook of Experimental Immunology, Volumes I-IV* (D.M. Weir and C. C. Blackwell eds 1986).

Standard abbreviations for nucleotides and amino acids are used in this specification.

Definitions

A composition containing X is "substantially free of" Y when at least 85% by weight of the total X+Y in the composition is X. Preferably, X comprises at least about 90% by weight of the total of X+Y in the composition, more preferably at least about 95% or even 99% by weight.

The term "comprising" means "including" as well as "consisting" *e.g.* a composition "comprising" X may consist exclusively of X or may include something additional *e.g.* X + Y.

The term "heterologous" refers to two biological components that are not found together in nature. The components may be host cells, genes, or regulatory regions, such as promoters. Although the heterologous components are not found together in nature, they can function together, as when a promoter heterologous to a gene is operably linked to the gene. Another example is where a streptococcus sequence is heterologous to a mouse host cell. A further examples would be two epitopes from the same or different proteins which have been assembled in a single protein in an arrangement not found in nature

An "origin of replication" is a polynucleotide sequence that initiates and regulates replication of polynucleotides, such as an expression vector. The origin of replication behaves as an autonomous unit of polynucleotide replication within a cell, capable of replication under its own control. An origin of replication may be needed for a vector to replicate in a particular host cell. With certain origins of replication, an expression vector can be reproduced at a high copy number in the presence of the appropriate proteins within the cell. Examples of origins are the autonomously replicating sequences, which are effective in yeast; and the viral T-antigen, effective in COS-7 cells.

A "mutant" sequence is defined as DNA, RNA or amino acid sequence differing from but having sequence identity with the native or disclosed sequence. Depending on the particular sequence, the degree of sequence identity between the native or disclosed sequence and the mutant sequence is preferably greater than 50% (*eg.* 60%, 70%, 80%, 90%, 95%, 99% or more, calculated using the Smith-Waterman algorithm as described above). As used herein, an "allelic variant" of a nucleic acid molecule, or region, for which nucleic acid sequence is provided herein is a nucleic acid molecule, or region, that occurs essentially at the same locus in the genome of another or second isolate, and that, due to natural variation caused by, for example, mutation or recombination, has a similar but not identical nucleic acid sequence. A coding region allelic variant typically encodes a protein having similar activity to that of the protein encoded by the gene to which it is being compared. An allelic variant can also comprise an alteration in the 5' or 3' untranslated regions of the gene, such as in regulatory control regions (*eg.* see US patent 5,753,235).

Expression systems

The streptococcus nucleotide sequences can be expressed in a variety of different expression systems; for example those used with mammalian cells, baculoviruses, plants, bacteria, and yeast.

i. Mammalian Systems

Mammalian expression systems are known in the art. A mammalian promoter is any DNA sequence capable of binding mammalian RNA polymerase and initiating the downstream (3') transcription of a coding sequence (*eg.* structural gene) into mRNA. A promoter will have a transcription initiating region, which is usually placed proximal to the 5' end of the coding sequence, and a TATA box, usually located 25-30 base pairs (bp) upstream of the transcription initiation site. The TATA box is thought to direct RNA polymerase II to begin RNA synthesis at the correct site. A mammalian promoter will also contain an upstream promoter element, usually located within 100 to 200 bp upstream of the TATA box. An upstream promoter element determines the rate at which transcription is initiated and can act in either orientation [Sambrook et al. (1989) "Expression of Cloned Genes in Mammalian Cells." In *Molecular Cloning: A Laboratory Manual, 2nd ed.]*.

Mammalian viral genes are often highly expressed and have a broad host range; therefore sequences encoding mammalian viral genes provide particularly useful promoter sequences. Examples include the SV40 early promoter, mouse mammary tumor virus LTR promoter, adenovirus major late promoter (Ad MLP), and herpes simplex virus promoter. In addition, sequences derived from non-viral genes, such as the murine metallotheionein gene, also provide useful promoter sequences. Expression may be either constitutive or regulated (inducible), depending on the promoter can be induced with glucocorticoid in hormone-responsive cells.

The presence of an enhancer element (enhancer), combined with the promoter elements described above, will usually increase expression levels. An enhancer is a regulatory DNA sequence that can stimulate transcription up to 1000-fold when linked to homologous or heterologous promoters, with synthesis beginning at the normal RNA start site. Enhancers are also active when they are placed upstream or downstream from the transcription initiation site, in either normal or flipped orientation, or at a distance of more than 1000 nucleotides from the promoter [Maniatis et al. (1987) *Science 236*:1237; Alberts et al. (1989) *Molecular Biology of the Cell*, 2nd ed.]. Enhancer elements derived from viruses may be particularly useful, because they usually have a broader host range. Examples include the SV40 early gene enhancer [Dijkema et al (1985) *EMBO J. 4*:761] and the enhancer/promoters derived from the long terminal repeat (LTR) of the Rous Sarcoma Virus [Gorman et al. (1982b) *Proc. Natl. Acad. Sci. 79*:6777] and from human cytomegalovirus [Boshart et al. (1985) *Cell 41*:521]. Additionally, some enhancers are regulatable and become active only in the presence of an inducer, such as a hormone or metal ion [Sassone-Corsi and Borelli (1986) *Trends Genet. 2*:215; Maniatis et al. (1987) *Science* 236:1237].

A DNA molecule may be expressed intracellularly in mammalian cells. A promoter sequence may be directly linked with the DNA molecule, in which case the first amino acid at the N-terminus of the recombinant protein will always be a methionine, which is encoded by the ATG start codon. If desired, the N-terminus may be cleaved from the protein by *in vitro* incubation with cyanogen bromide.

Alternatively, foreign proteins can also be secreted from the cell into the growth media by creating chimeric DNA molecules that encode a fusion protein comprised of a leader sequence fragment that provides for secretion of the foreign protein in mammalian

cells. Preferably, there are processing sites encoded between the leader fragment and the foreign gene that can be cleaved either *in vivo* or *in vitro*. The leader sequence fragment usually encodes a signal peptide comprised of hydrophobic amino acids which direct the secretion of the protein from the cell. The adenovirus triparite leader is an example of a leader sequence that provides for secretion of a foreign protein in mammalian cells.

Usually, transcription termination and polyadenylation sequences recognized by mammalian cells are regulatory regions located 3' to the translation stop codon and thus, together with the promoter elements, flank the coding sequence. The 3' terminus of the mature mRNA is formed by site-specific post-transcriptional cleavage and polyadenylation [Birnstiel et al. (1985) *Cell 41*:349; Proudfoot and Whitelaw (1988) "Termination and 3' end processing of eukaryotic RNA. In *Transcription and splicing* (ed. B.D. Hames and D.M. Glover); Proudfoot (1989) *Trends Biochem. Sci. 14*:105]. These sequences direct the transcription of an mRNA which can be translated into the polypeptide encoded by the DNA. Examples of transcription terminator/polyadenylation signals include those derived from SV40 [Sambrook et al (1989) "Expression of cloned genes in cultured mammalian cells." In *Molecular Cloning: A Laboratory Manual*].

Usually, the above described components, comprising a promoter, polyadenylation signal, and transcription termination sequence are put together into expression constructs. Enhancers, introns with functional splice donor and acceptor sites, and leader sequences may also be included in an expression construct, if desired. Expression constructs are often maintained in a replicon, such as an extrachromosomal element (eg. plasmids) capable of stable maintenance in a host, such as mammalian cells or bacteria. Mammalian replication systems include those derived from animal viruses, which require trans-acting factors to replicate. For example, plasmids containing the replication systems of papovaviruses, such as SV40 [Gluzman (1981) *Cell 23*:175] or polyomavirus, replicate to extremely high copy number in the presence of the appropriate viral T antigen. Additional examples of mammalian replicons include those derived from bovine papillomavirus and Epstein-Barr virus. Additionally, the replicon may have two replicaton systems, thus allowing it to be maintained, for example, in mammalian cells for expression and in a prokaryotic host for cloning and amplification. Examples of such mammalian-bacteria shuttle vectors include pMT2 [Kaufman et al. (1989) *Mol. Cell. Biol. 9*:946] and pHEBO [Shimizu et al. (1986) *Mol. Cell. Biol. 6*:1074].

The transformation procedure used depends upon the host to be transformed. Methods for introduction of heterologous polynucleotides into mammalian cells are known in the art and include dextran-mediated transfection, calcium phosphate precipitation, polybrene mediated transfection, protoplast fusion, electroporation, encapsulation of the polynucleotide(s) in liposomes, and direct microinjection of the DNA into nuclei.

Mammalian cell lines available as hosts for expression are known in the art and include many immortalized cell lines available from the American Type Culture Collection (ATCC), including but not limited to, Chinese hamster ovary (CHO) cells, HeLa cells, baby hamster kidney (BHK) cells, monkey kidney cells (COS), human hepatocellular carcinoma cells (eg. Hep G2), and a number of other cell lines.

ii. Baculovirus Systems

The polynucleotide encoding the protein can also be inserted into a suitable insect expression vector, and is operably linked to the control elements within that vector. Vector construction employs techniques which are known in the art. Generally, the components of the expression system include a transfer vector, usually a bacterial plasmid, which contains both a fragment of the baculovirus genome, and a convenient restriction site for insertion of the heterologous gene or genes to be expressed; a wild type baculovirus with a sequence homologous to the baculovirus-specific fragment in the transfer vector (this allows for the homologous recombination of the heterologous gene in to the baculovirus genome); and appropriate insect host cells and growth media.

After inserting the DNA sequence encoding the protein into the transfer vector, the vector and the wild type viral genome are transfected into an insect host cell where the vector and viral genome are allowed to recombine. The packaged recombinant virus is expressed and recombinant plaques are identified and purified. Materials and methods for baculovirus/insect cell expression systems are commercially available in kit form from, *inter alia*, Invitrogen, San Diego CA ("MaxBac" kit). These techniques are generally known to those skilled in the art and fully described in Summers and Smith, *Texas Agricultural Experiment Station Bulletin No. 1555* (1987) (hereinafter "Summers and Smith").

Prior to inserting the DNA sequence encoding the protein into the baculovirus genome, the above described components, comprising a promoter, leader (if desired), coding sequence, and transcription termination sequence, are usually assembled into an intermediate transplacement construct (transfer vector). This may contain a single gene and operably linked regulatory elements; multiple genes, each with its owned set of operably linked regulatory elements; or multiple genes, regulated by the same set of regulatory elements. Intermediate transplacement constructs are often maintained in a replicon, such as an extra-chromosomal

element (*e.g.* plasmids) capable of stable maintenance in a host, such as a bacterium. The replicon will have a replication system, thus allowing it to be maintained in a suitable host for cloning and amplification.

Currently, the most commonly used transfer vector for introducing foreign genes into AcNPV is pAc373. Many other vectors, known to those of skill in the art, have also been designed. These include, for example, pVL985 (which alters the polyhedrin start codon from ATG to ATT, and which introduces a BamHI cloning site 32 basepairs downstream from the ATT; see Luckow and Summers, *Virology* (1989) *17*:31.

The plasmid usually also contains the polyhedrin polyadenylation signal (Miller et al. (1988)*Ann. Rev. Microbiol., 42*:177) and a prokaryotic ampicillin-resistance (*amp*) gene and origin of replication for selection and propagation in *E.coli*.

Baculovirus transfer vectors usually contain a baculovirus promoter. A baculovirus promoter is any DNA sequence capable of binding a baculovirus RNA polymerase and initiating the downstream (5' to 3') transcription of a coding sequence (*eg.* structural gene) into mRNA. A promoter will have a transcription initiation region which is usually placed proximal to the 5' end of the coding sequence. This transcription initiation region usually includes an RNA polymerase binding site and a transcription initiation site. A baculovirus transfer vector may also have a second domain called an enhancer, which, if present, is usually distal to the structural gene. Expression may be either regulated or constitutive.

Structural genes, abundantly transcribed at late times in a viral infection cycle, provide particularly useful promoter sequences. Examples include sequences derived from the gene encoding the viral polyhedron protein, Friesen et al., (1986) "The Regulation of Baculovirus Gene Expression," in: *The Molecular Biology of Baculoviruses* (ed. Walter Doerfler); EPO Publ. Nos. 127 839 and 155 476; and the gene encoding the p10 protein, Vlak et al., (1988), *J. Gen. Virol. 69*:765.

DNA encoding suitable signal sequences can be derived from genes for secreted insect or baculovirus proteins, such as the baculovirus polyhedrin gene (Carbonell et al. (1988) *Gene, 73*:409). Alternatively, since the signals for mammalian cell posttranslational modifications (such as signal peptide cleavage, proteolytic cleavage, and phosphorylation) appear to be recognized by insect cells, and the signals required for secretion and nuclear accumulation also appear to be conserved between the invertebrate cells and vertebrate cells, leaders of non-insect origin, such as those derived from genes encoding human α-interferon, Maeda et al., (1985), *Nature 315*:592; human gastrin-releasing peptide, Lebacq-Verheyden et al., (1988), *Molec. Cell. Biol. 8*:3129; human IL-2, Smith et al., (1985) *Proc. Nat'l Acad. Sci. USA, 82*:8404; mouse IL-3, (Miyajima et al., (1987) *Gene 58*:273; and human glucocerebrosidase, Martin et al. (1988) *DNA, 7*:99, can also be used to provide for secretion in insects.

A recombinant polypeptide or polyprotein may be expressed intracellularly or, if it is expressed with the proper regulatory sequences, it can be secreted. Good intracellular expression of nonfused foreign proteins usually requires heterologous genes that ideally have a short leader sequence containing suitable translation initiation signals preceding an ATG start signal. If desired, methionine at the N-terminus may be cleaved from the mature protein by *in vitro* incubation with cyanogen bromide.

Alternatively, recombinant polyproteins or proteins which are not naturally secreted can be secreted from the insect cell by creating chimeric DNA molecules that encode a fusion protein comprised of a leader sequence fragment that provides for secretion of the foreign protein in insects. The leader sequence fragment usually encodes a signal peptide comprised of hydrophobic amino acids which direct the translocation of the protein into the endoplasmic reticulum.

After insertion of the DNA sequence and/or the gene encoding the expression product precursor of the protein, an insect cell host is co-transformed with the heterologous DNA of the transfer vector and the genomic DNA of wild type baculovirus -- usually by co-transfection. The promoter and transcription termination sequence of the construct will usually comprise a 2-5kb section of the baculovirus genome. Methods for introducing heterologous DNA into the desired site in the baculovirus virus are known in the art. (See Summers and Smith *supra*; Ju et al. (1987); Smith et al., *Mol. Cell. Biol.* (1983) *3*:2156; and Luckow and Summers (1989)). For example, the insertion can be into a gene such as the polyhedrin gene, by homologous double crossover recombination; insertion can also be into a restriction enzyme site engineered into the desired baculovirus gene. Miller et al., (1989), *Bioessays 4*:91.The DNA sequence, when cloned in place of the polyhedrin gene in the expression vector, is flanked both 5' and 3' by polyhedrin-specific sequences and is positioned downstream of the polyhedrin promoter.

The newly formed baculovirus expression vector is subsequently packaged into an infectious recombinant baculovirus. Homologous recombination occurs at low frequency (between about 1% and about 5%); thus, the majority of the virus produced after cotransfection is still wild-type virus. Therefore, a method is necessary to identify recombinant viruses. An advantage of the expression system is a visual screen allowing recombinant viruses to be distinguished. The polyhedrin protein, which is produced by the native virus, is produced at very high levels in the nuclei of infected cells at late times after viral infection. Accumulated polyhedrin protein forms occlusion bodies that also contain embedded particles. These occlusion bodies, up to 15 μm in size, are

highly refractile, giving them a bright shiny appearance that is readily visualized under the light microscope. Cells infected with recombinant viruses lack occlusion bodies. To distinguish recombinant virus from wild-type virus, the transfection supernatant is plaqued onto a monolayer of insect cells by techniques known to those skilled in the art. Namely, the plaques are screened under the light microscope for the presence (indicative of wild-type virus) or absence (indicative of recombinant virus) of occlusion bodies. "Current Protocols in Microbiology" Vol. 2 (Ausubel et al. eds) at 16.8 (Supp. 10, 1990); Summers and Smith, *supra*; Miller et al. (1989).

Recombinant baculovirus expression vectors have been developed for infection into several insect cells. For example, recombinant baculoviruses have been developed for, *inter alia*: *Aedes aegypti*, *Autographa californica*, *Bombyx mori*, *Drosophila melanogaster*, *Spodoptera frugiperda*, and *Trichoplusia ni* (WO 89/046699; Carbonell et al., (1985) *J. Virol. 56*:153; Wright (1986) *Nature 321*:718; Smith et al., (1983) *Mol. Cell. Biol. 3*:2156; and see generally, Fraser, *et al.* (1989) *In Vitro Cell. Dev. Biol. 25*:225).

Cells and cell culture media are commercially available for both direct and fusion expression of heterologous polypeptides in a baculovirus/expression system; cell culture technology is generally known to those skilled in the art. *See, eg.* Summers and Smith *supra*.

The modified insect cells may then be grown in an appropriate nutrient medium, which allows for stable maintenance of the plasmid(s) present in the modified insect host. Where the expression product gene is under inducible control, the host may be grown to high density, and expression induced. Alternatively, where expression is constitutive, the product will be continuously expressed into the medium and the nutrient medium must be continuously circulated, while removing the product of interest and augmenting depleted nutrients. The product may be purified by such techniques as chromatography, *eg.* HPLC, affinity chromatography, ion exchange chromatography, *etc.*; electrophoresis; density gradient centrifugation; solvent extraction, *etc.* As appropriate, the product may be further purified, as required, so as to remove substantially any insect proteins which are also present in the medium, so as to provide a product which is at least substantially free of host debris, eg. proteins, lipids and polysaccharides.

In order to obtain protein expression, recombinant host cells derived from the transformants are incubated under conditions which allow expression of the recombinant protein encoding sequence. These conditions will vary, dependent upon the host cell selected. However, the conditions are readily ascertainable to those of ordinary skill in the art, based upon what is known in the art.

iii. Plant Systems

There are many plant cell culture and whole plant genetic expression systems known in the art. Exemplary plant cellular genetic expression systems include those described in patents, such as: US 5,693,506; US 5,659,122; and US 5,608,143. Additional examples of genetic expression in plant cell culture has been described by Zenk, *Phytochemistry* 30:3861-3863 (1991). Descriptions of plant protein signal peptides may be found in addition to the references described above in Vaulcombe et al., *Mol. Gen. Genet.* 209:33-40 (1987); Chandler et al., *Plant Molecular Biology* 3:407-418 (1984); Rogers, *J. Biol. Chem.* 260:3731-3738 (1985); Rothstein et al., *Gene* 55:353-356 (1987); Whittier et al., Nucleic Acids Research 15:2515-2535 (1987); Wirsel et al., *Molecular Microbiology* 3:3-14 (1989); Yu et al., *Gene* 122:247-253 (1992). A description of the regulation of plant gene expression by the phytohormone, gibberellic acid and secreted enzymes induced by gibberellic acid can be found in R.L. Jones and J. MacMillin, Gibberellins: in: *Advanced Plant Physiology*, Malcolm B. Wilkins, ed., 1984 Pitman Publishing Limited, London, pp. 21-52. References that describe other metabolically-regulated genes: Sheen, *Plant Cell*, 2:1027-1038(1990); Maas et al., *EMBO J.* 9:3447-3452 (1990); Benkel and Hickey, *Proc. Natl. Acad. Sci.* 84:1337-1339 (1987).

Typically, using techniques known in the art, a desired polynucleotide sequence is inserted into an expression cassette comprising genetic regulatory elements designed for operation in plants. The expression cassette is inserted into a desired expression vector with companion sequences upstream and downstream from the expression cassette suitable for expression in a plant host. The companion sequences will be of plasmid or viral origin and provide necessary characteristics to the vector to permit the vectors to move DNA from an original cloning host, such as bacteria, to the desired plant host. The basic bacterial/plant vector construct will preferably provide a broad host range prokaryote replication origin; a prokaryote selectable marker; and, for Agrobacterium transformations, T DNA sequences for Agrobacterium-mediated transfer to plant chromosomes. Where the heterologous gene is not readily amenable to detection, the construct will preferably also have a selectable marker gene suitable for determining if a plant cell has been transformed. A general review of suitable markers, for example for the members of the grass family, is found in Wilmink and Dons, 1993, *Plant Mol. Biol. Reptr*, 11(2):165-185.

Sequences suitable for permitting integration of the heterologous sequence into the plant genome are also recommended. These might include transposon sequences and the like for homologous recombination as well as Ti sequences which permit random insertion of a heterologous expression cassette into a plant genome. Suitable prokaryote selectable markers include resistance toward antibiotics such as ampicillin or tetracycline. Other DNA sequences encoding additional functions may also be present in the vector, as is known in the art.

The nucleic acid molecules of the subject invention may be included into an expression cassette for expression of the protein(s) of interest. Usually, there will be only one expression cassette, although two or more are feasible. The recombinant expression cassette will contain in addition to the heterologous protein encoding sequence the following elements, a promoter region, plant 5' untranslated sequences, initiation codon depending upon whether or not the structural gene comes equipped with one, and a transcription and translation termination sequence. Unique restriction enzyme sites at the 5' and 3' ends of the cassette allow for easy insertion into a pre-existing vector.

A heterologous coding sequence may be for any protein relating to the present invention. The sequence encoding the protein of interest will encode a signal peptide which allows processing and translocation of the protein, as appropriate, and will usually lack any sequence which might result in the binding of the desired protein of the invention to a membrane. Since, for the most part, the transcriptional initiation region will be for a gene which is expressed and translocated during germination, by employing the signal peptide which provides for translocation, one may also provide for translocation of the protein of interest. In this way, the protein(s) of interest will be translocated from the cells in which they are expressed and may be efficiently harvested. Typically secretion in seeds are across the aleurone or scutellar epithelium layer into the endosperm of the seed. While it is not required that the protein be secreted from the cells in which the protein is produced, this facilitates the isolation and purification of the recombinant protein.

Since the ultimate expression of the desired gene product will be in a eucaryotic cell it is desirable to determine whether any portion of the cloned gene contains sequences which will be processed out as introns by the host's splicosome machinery. If so, site-directed mutagenesis of the "intron" region may be conducted to prevent losing a portion of the genetic message as a false intron code, Reed and Maniatis, *Cell* 41:95-105, 1985.

The vector can be microinjected directly into plant cells by use of micropipettes to mechanically transfer the recombinant DNA. Crossway, *Mol. Gen. Genet*, 202:179-185, 1985. The genetic material may also be transferred into the plant cell by using polyethylene glycol, Krens, et al., *Nature*, 296, 72-74, 1982. Another method of introduction of nucleic acid segments is high velocity ballistic penetration by small particles with the nucleic acid either within the matrix of small beads or particles, or on the surface, Klein, et al., *Nature*, 327, 70-73, 1987 and Knudsen and Muller, 1991, *Planta*, 185:330-336 teaching particle bombardment of barley endosperm to create transgenic barley. Yet another method of introduction would be fusion of protoplasts with other entities, either minicells, cells, lysosomes or other fusible lipid-surfaced bodies, Fraley, et al., *Proc. Natl. Acad. Sci. USA*, 79, 1859-1863, 1982.

The vector may also be introduced into the plant cells by electroporation. (Fromm et al., *Proc. Natl Acad. Sci. USA* 82:5824, 1985). In this technique, plant protoplasts are electroporated in the presence of plasmids containing the gene construct. Electrical impulses of high field strength reversibly permeabilize biomembranes allowing the introduction of the plasmids. Electroporated plant protoplasts reform the cell wall, divide, and form plant callus.

All plants from which protoplasts can be isolated and cultured to give whole regenerated plants can be transformed by the present invention so that whole plants are recovered which contain the transferred gene. It is known that practically all plants can be regenerated from cultured cells or tissues, including but not limited to all major species of sugarcane, sugar beet, cotton, fruit and other trees, legumes and vegetables. Some suitable plants include, for example, species from the genera *Fragaria*, *Lotus*, *Medicago*, *Onobrychis*, *Trifolium*, *Trigonella*, *Vigna*, *Citrus*, *Linum*, *Geranium*, *Manihot*, *Daucus*, *Arabidopsis*, *Brassica*, *Raphanus*, *Sinapis*, *Atropa*, *Capsicum*, *Datura*, *Hyoscyamus*, *Lycopersion*, *Nicotiana*, *Solanum*, *Petunia*, *Digitalis*, *Majorana*, *Cichorium*, *Helianthus*, *Lactuca*, *Bromus*, *Asparagus*, *Antirrhinum*, *Hererocallis*, *Nemesia*, *Pelargonium*, *Panicum*, *Pennisetum*, *Ranunculus*, *Senecio*, *Salpiglossis*, *Cucumis*, *Browaalia*, *Glycine*, *Lolium*, *Zea*, *Triticum*, *Sorghum*, and *Datura*.

Means for regeneration vary from species to species of plants, but generally a suspension of transformed protoplasts containing copies of the heterologous gene is first provided. Callus tissue is formed and shoots may be induced from callus and subsequently rooted. Alternatively, embryo formation can be induced from the protoplast suspension. These embryos germinate as natural embryos to form plants. The culture media will generally contain various amino acids and hormones, such as auxin and cytokinins. It is also advantageous to add glutamic acid and proline to the medium, especially for such species as corn and alfalfa. Shoots and

roots normally develop simultaneously. Efficient regeneration will depend on the medium, on the genotype, and on the history of the culture. If these three variables are controlled, then regeneration is fully reproducible and repeatable.

In some plant cell culture systems, the desired protein of the invention may be excreted or alternatively, the protein may be extracted from the whole plant. Where the desired protein of the invention is secreted into the medium, it may be collected. Alternatively, the embryos and embryoless-half seeds or other plant tissue may be mechanically disrupted to release any secreted protein between cells and tissues. The mixture may be suspended in a buffer solution to retrieve soluble proteins. Conventional protein isolation and purification methods will be then used to purify the recombinant protein. Parameters of time, temperature pH, oxygen, and volumes will be adjusted through routine methods to optimize expression and recovery of heterologous protein.

iv. Bacterial Systems

Bacterial expression techniques are known in the art. A bacterial promoter is any DNA sequence capable of binding bacterial RNA polymerase and initiating the downstream (3') transcription of a coding sequence (*eg.* structural gene) into mRNA. A promoter will have a transcription initiation region which is usually placed proximal to the 5' end of the coding sequence. This transcription initiation region usually includes an RNA polymerase binding site and a transcription initiation site. A bacterial promoter may also have a second domain called an operator, that may overlap an adjacent RNA polymerase binding site at which RNA synthesis begins. The operator permits negative regulated (inducible) transcription, as a gene repressor protein may bind the operator and thereby inhibit transcription of a specific gene. Constitutive expression may occur in the absence of negative regulatory elements, such as the operator. In addition, positive regulation may be achieved by a gene activator protein binding sequence, which, if present is usually proximal (5') to the RNA polymerase binding sequence. An example of a gene activator protein is the catabolite activator protein (CAP), which helps initiate transcription of the lac operon in Escherichia coli (*E.coli*) [Raibaud *et al.* (1984) *Annu. Rev. Genet. 18*:173]. Regulated expression may therefore be either positive or negative, thereby either enhancing or reducing transcription.

Sequences encoding metabolic pathway enzymes provide particularly useful promoter sequences. Examples include promoter sequences derived from sugar metabolizing enzymes, such as galactose, lactose (*lac*) [Chang *et al.* (1977) *Nature 198*:1056], and maltose. Additional examples include promoter sequences derived from biosynthetic enzymes such as tryptophan (*trp*) [Goeddel *et al.* (1980) *Nuc. Acids Res. 8*:4057; Yelverton *et al.* (1981) *Nucl. Acids Res. 9*:731; US patent 4,738,921; EP-A-0036776 and EP-A-0121775]. The g-laotamase (*bla*) promoter system [Weissmann (1981) "The cloning of interferon and other mistakes." In *Interferon 3* (ed. I. Gresser)], bacteriophage lambda PL [Shimatake *et al.* (1981) *Nature 292*:128] and T5 [US patent 4,689,406] promoter systems also provide useful promoter sequences.

In addition, synthetic promoters which do not occur in nature also function as bacterial promoters. For example, transcription activation sequences of one bacterial or bacteriophage promoter may be joined with the operon sequences of another bacterial or bacteriophage promoter, creating a synthetic hybrid promoter [US patent 4,551,433]. For example, the *tac* promoter is a hybrid *trp-lac* promoter comprised of both *trp* promoter and *lac* operon sequences that is regulated by the *lac* repressor [Amann *et al.* (1983) *Gene 25*:167; de Boer *et al.* (1983) *Proc. Natl. Acad. Sci. 80*:21]. Furthermore, a bacterial promoter can include naturally occurring promoters of non-bacterial origin that have the ability to bind bacterial RNA polymerase and initiate transcription. A naturally occurring promoter of non-bacterial origin can also be coupled with a compatible RNA polymerase to produce high levels of expression of some genes in prokaryotes. The bacteriophage T7 RNA polymerase/promoter system is an example of a coupled promoter system [Studier *et al.* (1986) *J. Mol. Biol. 189*:113; Tabor *et al.* (1985) *Proc Natl. Acad. Sci. 82*:1074]. In addition, a hybrid promoter can also be comprised of a bacteriophage promoter and an *E.coli* operator region (EPO-A-0 267 851).

In addition to a functioning promoter sequence, an efficient ribosome binding site is also useful for the expression of foreign genes in prokaryotes. In *E.coli*, the ribosome binding site is called the Shine-Dalgarno (SD) sequence and includes an initiation codon (ATG) and a sequence 3-9 nucleotides in length located 3-11 nucleotides upstream of the initiation codon [Shine *et al.* (1975) *Nature 254*:34]. The SD sequence is thought to promote binding of mRNA to the ribosome by the pairing of bases between the SD sequence and the 3' and of *E.coli* 16S rRNA [Steitz *et al.* (1979) "Genetic signals and nucleotide sequences in messenger RNA." In *Biological Regulation and Development: Gene Expression* (ed. R.F. Goldberger)]. To express eukaryotic genes and prokaryotic genes with weak ribosome-binding site [Sambrook *et al.* (1989) "Expression of cloned genes in Escherichia coli." In *Molecular Cloning: A Laboratory Manual*].

A DNA molecule may be expressed intracellularly. A promoter sequence may be directly linked with the DNA molecule, in which case the first amino acid at the N-terminus will always be a methionine, which is encoded by the ATG start codon. If desired, methionine at the N-terminus may be cleaved from the protein by *in vitro* incubation with cyanogen bromide or by either *in vivo* on *in vitro* incubation with a bacterial methionine N-terminal peptidase (EP-A-0 219 237).

Fusion proteins provide an alternative to direct expression. Usually, a DNA sequence encoding the N-terminal portion of an endogenous bacterial protein, or other stable protein, is fused to the 5' end of heterologous coding sequences. Upon expression, this construct will provide a fusion of the two amino acid sequences. For example, the bacteriophage lambda cell gene can be linked at the 5' terminus of a foreign gene and expressed in bacteria. The resulting fusion protein preferably retains a site for a processing enzyme (factor Xa) to cleave the bacteriophage protein from the foreign gene [Nagai *et al.* (1984) *Nature 309*:810]. Fusion proteins can also be made with sequences from the *lacZ* [Jia *et al.* (1987) *Gene 60*:197], *trpE* [Allen et al. (1987) J. Biotechnol. 5:93; Makoff *et al.* (1989) *J. Gen. Microbiol. 135*:11], and *Chey* [EP-A-0 324 647] genes. The DNA sequence at the junction of the two amino acid sequences may or may not encode a cleavable site. Another example is a ubiquitin fusion protein. Such a fusion protein is made with the ubiquitin region that preferably retains a site for a processing enzyme (*e.g.* ubiquitin specific processing-protease) to cleave the ubiquitin from the foreign protein. Through this method, native foreign protein can be isolated [Miller *et al.* (1989) *Bio/Technology 7*:698].

Alternatively, foreign proteins can also be secreted from the cell by creating chimeric DNA molecules that encode a fusion protein comprised of a signal peptide sequence fragment that provides for secretion of the foreign protein in bacteria [US patent 4,336,336]. The signal sequence fragment usually encodes a signal peptide comprised of hydrophobic amino acids which direct the secretion of the protein from the cell. The protein is either secreted into the growth media (gram-positive bacteria) or into the periplasmic space, located between the inner and outer membrane of the cell (gram-negative bacteria). Preferably there are processing sites, which can be cleaved either *in vivo* or *in vitro* encoded between the signal peptide fragment and the foreign gene.

DNA encoding suitable signal sequences can be derived from genes for secreted bacterial proteins, such as the *E.coli* outer membrane protein gene (*ompA*) [Masui *et al.* (1983), in: *Experimental Manipulation of Gene Expression*; Ghrayeb *et al.* (1984) *EMBO J. 3*:2437] and the *E.coli* alkaline phosphatase signal sequence (*phoA*) [Oka *et al.* (1985) *Proc. Natl. Acad. Sci. 82*:7212]. As an additional example, the signal sequence of the alpha-amylase gene from various Bacillus strains can be used to secrete heterologous proteins from *B. subtilis* [Palva *et al.* (1982) *Proc. Natl. Acad. Sci. USA 79*:5582; EP-A-0 244 042].

Usually, transcription termination sequences recognized by bacteria are regulatory regions located 3' to the translation stop codon, and thus together with the promoter flank the coding sequence. These sequences direct the transcription of an mRNA which can be translated into the polypeptide encoded by the DNA. Transcription termination sequences frequently include DNA sequences of about 50 nucleotides capable of forming stem loop structures that aid in terminating transcription. Examples include transcription termination sequences derived from genes with strong promoters, such as the *trp* gene in *E.coli* as well as other biosynthetic genes.

Usually, the above described components, comprising a promoter, signal sequence (if desired), coding sequence of interest, and transcription termination sequence, are put together into expression constructs. Expression constructs are often maintained in a replicon, such as an extrachromosomal element (*eg.* plasmids) capable of stable maintenance in a host, such as bacteria. The replicon will have a replication system, thus allowing it to be maintained in a prokaryotic host either for expression or for cloning and amplification. In addition, a replicon may be either a high or low copy number plasmid. A high copy number plasmid will generally have a copy number ranging from about 5 to about 200, and usually about 10 to about 150. A host containing a high copy number plasmid will preferably contain at least about 10, and more preferably at least about 20 plasmids. Either a high or low copy number vector may be selected, depending upon the effect of the vector and the foreign protein on the host.

Alternatively, the expression constructs can be integrated into the bacterial genome with an integrating vector. Integrating vectors usually contain at least one sequence homologous to the bacterial chromosome that allows the vector to integrate. Integrations appear to result from recombinations between homologous DNA in the vector and the bacterial chromosome. For example, integrating vectors constructed with DNA from various Bacillus strains integrate into the Bacillus chromosome (EP-A- 0 127 328). Integrating vectors may also be comprised of bacteriophage or transposon sequences.

Usually, extrachromosomal and integrating expression constructs may contain selectable markers to allow for the selection of bacterial strains that have been transformed. Selectable markers can be expressed in the bacterial host and may include genes which render bacteria resistant to drugs such as ampicillin, chloramphenicol, erythromycin, kanamycin (neomycin), and tetracycline [Davies *et al.* (1978) *Annu. Rev. Microbiol. 32*:469]. Selectable markers may also include biosynthetic genes, such as those in the histidine, tryptophan, and leucine biosynthetic pathways.

Alternatively, some of the above described components can be put together in transformation vectors. Transformation vectors are usually comprised of a selectable market that is either maintained in a replicon or developed into an integrating vector, as described above.

Expression and transformation vectors, either extra-chromosomal replicons or integrating vectors, have been developed for transformation into many bacteria. For example, expression vectors have been developed for, *inter alia*, the following bacteria: Bacillus subtilis [Palva *et al.* (1982) *Proc. Natl. Acad. Sci. USA 79*:5582; EP-A-0 036 259 and EP-A-0 063 953; WO 84/04541], Escherichia coli [Shimatake *et al.* (1981) *Nature 292*:128; Amann *et al.* (1985) *Gene 40*:183; Studier *et al.* (1986) *J. Mol. Biol. 189*:113; EP-A-0 036 776,EP-A-0 136 829 and EP-A-0 136 907], Streptococcus cremoris [Powell *et al.* (1988) *Appl. Environ. Microbiol. 54*:655]; Streptococcus lividans [Powell *et al.* (1988) *Appl. Environ. Microbiol. 54*:655], Streptomyces lividans [US patent 4,745,056].

Methods of introducing exogenous DNA into bacterial hosts are well-known in the art, and usually include either the transformation of bacteria treated with $CaCl_2$ or other agents, such as divalent cations and DMSO. DNA can also be introduced into bacterial cells by electroporation. Transformation procedures usually vary with the bacterial species to be transformed. See *eg.* [Masson *et al.* (1989) *FEMS Microbiol. Lett. 60*:273; Palva *et al.* (1982) *Proc. Natl. Acad. Sci. USA 79*:5582; EP-A-0 036 259 and EP-A-0 063 953; WO 84/04541, Bacillus], [Miller *et al.* (1988) *Proc. Natl. Acad. Sci. 85*:856; Wang *et al.* (1990) *J. Bacteriol. 172*:949, Campylobacter], [Cohen *et al.* (1973) *Proc. Natl. Acad. Sci. 69*:2110; Dower *et al.* (1988) *Nucleic Acids Res. 16*:6127; Kushner (1978) "An improved method for transformation of Escherichia coli with ColE1-derived plasmids. In *Genetic Engineering: Proceedings of the International Symposium on Genetic Engineering* (eds. H.W. Boyer and S. Nicosia); Mandel *et al.* (1970) *J. Mol. Biol. 53*:159; Taketo (1988) *Biochim. Biophys. Acta 949*:318; Escherichia], [Chassy *et al.* (1987) *FEMS Microbiol. Lett. 44*:173 Lactobacillus]; [Fiedler *et al.* (1988) *Anal. Biochem 170*:38, Pseudomonas]; [Augustin *et al.* (1990) *FEMS Microbiol. Lett. 66*:203, Staphylococcus], [Barany *et al.* (1980) *J. Bacteriol. 144*:698; Harlander (1987) "Transformation of Streptococcus lactis by electroporation, in: *Streptococcal Genetics* (ed. J. Ferretti and R. Curtiss III); Perry *et al.* (1981) *Infect. Immun. 32*:1295; Powell *et al.* (1988) *Appl. Environ. Microbiol. 54*:655; Somkuti *et al.* (1987) *Proc. 4th Evr. Cong. Biotechnology 1*:412, Streptococcus].

v. Yeast Expression

Yeast expression systems are also known to one of ordinary skill in the art. A yeast promoter is any DNA sequence capable of binding yeast RNA polymerase and initiating the downstream (3') transcription of a coding sequence (*eg.* structural gene) into mRNA. A promoter will have a transcription initiation region which is usually placed proximal to the 5' end of the coding sequence. This transcription initiation region usually includes an RNA polymerase binding site (the "TATA Box") and a transcription initiation site. A yeast promoter may also have a second domain called an upstream activator sequence (UAS), which, if present, is usually distal to the structural gene. The UAS permits regulated (inducible) expression. Constitutive expression occurs in the absence of a UAS. Regulated expression may be either positive or negative, thereby either enhancing or reducing transcription.

Yeast is a fermenting organism with an active metabolic pathway, therefore sequences encoding enzymes in the metabolic pathway provide particularly useful promoter sequences. Examples include alcohol dehydrogenase (ADH) (EP-A-0 284 044), enolase, glucokinase, glucose-6-phosphate isomerase, glyceraldehyde-3-phosphate-dehydrogenase (GAP or GAPDH), hexokinase, phosphofructokinase, 3-phosphoglycerate mutase, and pyruvate kinase (PyK) (EPO-A-0 329 203). The yeast *PHO5* gene, encoding acid phosphatase, also provides useful promoter sequences [Myanohara *et al.* (1983) *Proc. Natl. Acad. Sci. USA 80*:1].

In addition, synthetic promoters which do not occur in nature also function as yeast promoters. For example, UAS sequences of one yeast promoter may be joined with the transcription activation region of another yeast promoter, creating a synthetic hybrid promoter. Examples of such hybrid promoters include the ADH regulatory sequence linked to the GAP transcription activation region (US Patent Nos. 4,876,197 and 4,880,734). Other examples of hybrid promoters include promoters which consist of the regulatory sequences of either the *ADH2*, *GAL4*, *GAL10*, OR *PHO5* genes, combined with the transcriptional activation region of a glycolytic enzyme gene such as GAP or PyK (EP-A-0 164 556). Furthermore, a yeast promoter can include naturally occurring promoters of non-yeast origin that have the ability to bind yeast RNA polymerase and initiate transcription. Examples of such promoters include, *inter alia*, [Cohen *et al.* (1980) *Proc. Natl. Acad. Sci. USA 77*:1078; Henikoff *et al.* (1981) *Nature 283*:835; Hollenberg *et al.* (1981) *Curr. Topics Microbiol. Immunol. 96*:119; Hollenberg *et al.* (1979) "The Expression of Bacterial Antibiotic Resistance Genes in the Yeast Saccharomyces cerevisiae," in: *Plasmids of Medical, Environmental and Commercial Importance* (eds. K.N. Timmis and A. Puhler); Mercenau-Puigalon *et al.* (1980) *Gene 11*:163; Panthier *et al.* (1980) *Curr. Genet. 2*:109;].

A DNA molecule may be expressed intracellularly in yeast. A promoter sequence may be directly linked with the DNA molecule, in which case the first amino acid at the N-terminus of the recombinant protein will always be a methionine, which is encoded by

the ATG start codon. If desired, methionine at the N-terminus may be cleaved from the protein by *in vitro* incubation with cyanogen bromide.

Fusion proteins provide an alternative for yeast expression systems, as well as in mammalian, baculovirus, and bacterial expression systems. Usually, a DNA sequence encoding the N-terminal portion of an endogenous yeast protein, or other stable protein, is fused to the 5' end of heterologous coding sequences. Upon expression, this construct will provide a fusion of the two amino acid sequences. For example, the yeast or human superoxide dismutase (SOD) gene, can be linked at the 5' terminus of a foreign gene and expressed in yeast. The DNA sequence at the junction of the two amino acid sequences may or may not encode a cleavable site. See *eg.* EP-A-0 196 056. Another example is a ubiquitin fusion protein. Such a fusion protein is made with the ubiquitin region that preferably retains a site for a processing enzyme (*eg.* ubiquitin-specific processing protease) to cleave the ubiquitin from the foreign protein. Through this method, therefore, native foreign protein can be isolated (*eg.* WO88/024066).

Alternatively, foreign proteins can also be secreted from the cell into the growth media by creating chimeric DNA molecules that encode a fusion protein comprised of a leader sequence fragment that provide for secretion in yeast of the foreign protein. Preferably, there are processing sites encoded between the leader fragment and the foreign gene that can be cleaved either *in vivo* or *in vitro*. The leader sequence fragment usually encodes a signal peptide comprised of hydrophobic amino acids which direct the secretion of the protein from the cell.

DNA encoding suitable signal sequences can be derived from genes for secreted yeast proteins, such as the yeast invertase gene (EP-A-0 012 873; JPO. 62,096,086) and the A-factor gene (US patent 4,588,684). Alternatively, leaders of non-yeast origin, such as an interferon leader, exist that also provide for secretion in yeast (EP-A-0 060 057).

A preferred class of secretion leaders are those that employ a fragment of the yeast alpha-factor gene, which contains both a "pre" signal sequence, and a "pro" region. The types of alpha-factor fragments that can be employed include the full-length pre-pro alpha factor leader (about 83 amino acid residues) as well as truncated alpha-factor leaders (usually about 25 to about 50 amino acid residues) (US Patents 4,546,083 and 4,870,008; EP-A-0 324 274). Additional leaders employing an alpha-factor leader fragment that provides for secretion include hybrid alpha-factor leaders made with a presequence of a first yeast, but a pro-region from a second yeast alphafactor. (*eg.* see WO 89/02463.)

Usually, transcription termination sequences recognized by yeast are regulatory regions located 3' to the translation stop codon, and thus together with the promoter flank the coding sequence. These sequences direct the transcription of an mRNA which can be translated into the polypeptide encoded by the DNA. Examples of transcription terminator sequence and other yeast-recognized termination sequences, such as those coding for glycolytic enzymes.

Usually, the above described components, comprising a promoter, leader (if desired), coding sequence of interest, and transcription termination sequence, are put together into expression constructs. Expression constructs are often maintained in a replicon, such as an extrachromosomal element (*eg.* plasmids) capable of stable maintenance in a host, such as yeast or bacteria. The replicon may have two replication systems, thus allowing it to be maintained, for example, in yeast for expression and in a prokaryotic host for cloning and amplification. Examples of such yeast-bacteria shuttle vectors include YEp24 [Botstein *et al.* (1979) *Gene* 8:17-24], pCl/1 [Brake *et al.* (1984) *Proc. Natl. Acad. Sci USA 81*:4642-4646], and YRp17 [Stinchcomb *et al.* (1982) *J. Mol. Biol. 158*:157]. In addition, a replicon may be either a high or low copy number plasmid. A high copy number plasmid will generally have a copy number ranging from about 5 to about 200, and usually about 10 to about 150. A host containing a high copy number plasmid will preferably have at least about 10, and more preferably at least about 20. Enter a high or low copy number vector may be selected, depending upon the effect of the vector and the foreign protein on the host. See *eg.* Brake *et al.*, *supra*.

Alternatively, the expression constructs can be integrated into the yeast genome with an integrating vector. Integrating vectors usually contain at least one sequence homologous to a yeast chromosome that allows the vector to integrate, and preferably contain two homologous sequences flanking the expression construct. Integrations appear to result from recombinations between homologous DNA in the vector and the yeast chromosome [Orr-Weaver *et al.* (1983) *Methods in Enzymol. 101*:228-245]. An integrating vector may be directed to a specific locus in yeast by selecting the appropriate homologous sequence for inclusion in the vector. See Orr-Weaver *et al.*, *supra*. One or more expression construct may integrate, possibly affecting levels of recombinant protein produced [Rine *et al.* (1983) *Proc. Natl. Acad. Sci. USA 80*:6750]. The chromosomal sequences included in the vector can occur either as a single segment in the vector, which results in the integration of the entire vector, or two segments homologous to adjacent segments in the chromosome and flanking the expression construct in the vector, which can result in the stable integration of only the expression construct.

Usually, extrachromosomal and integrating expression constructs may contain selectable markers to allow for the selection of yeast strains that have been transformed. Selectable markers may include biosynthetic genes that can be expressed in the yeast host, such as *ADE2*, *HIS4*, *LEU2*, *TRP1*, and *ALG7*, and the G418 resistance gene, which confer resistance in yeast cells to tunicamycin and G418, respectively. In addition, a suitable selectable marker may also provide yeast with the ability to grow in the presence of toxic compounds, such as metal. For example, the presence of *CUP1* allows yeast to grow in the presence of copper ions [Butt *et al.* (1987) *Microbiol, Rev. 51*:351].

Alternatively, some of the above described components can be put together into transformation vectors. Transformation vectors are usually comprised of a selectable marker that is either maintained in a replicon or developed into an integrating vector, as described above.

Expression and transformation vectors, either extrachromosomal replicons or integrating vectors, have been developed for transformation into many yeasts. For example, expression vectors have been developed for, *inter alia*, the following yeasts:Candida albicans [Kurtz, *et al.* (1986) *Mol. Cell. Biol. 6*:142], Candida maltosa [Kunze, *et al.* (1985) *J. Basic Microbiol. 25*:141], Hansenula polymorpha [Gleeson, *et al.* (1986) *J. Gen. Microbiol. 132*:3459; Roggenkamp *et al.* (1986) *Mol. Gen. Genet. 202*:302], Kluyveromyces fragilis [Das, *et al.* (1984) *J. Bacteriol. 158*:1165], Kluyveromyces lactis [De Louvencourt *et al.* (1983) *J. Bacteriol. 154*:737; Van den Berg *et al.* (1990) *Bio/Technology 8*:135], Pichia guillerimondii [Kunze *et al.* (1985) *J. Basic Microbiol. 25*:141], Pichia pastoris [Cregg, *et al.* (1985) *Mol. Cell. Biol. 5*:3376; US Patent Nos. 4,837,148 and 4,929,555], Saccharomyces cerevisiae [Hinnen *et al.* (1978) *Proc. Natl. Acad. Sci. USA 75*:1929; Ito *et al.* (1983) *J. Bacteriol. 153*:163], Schizosaccharomyces pombe [Beach and Nurse (1981) *Nature 300*:706], and Yarrowia lipolyica [Davidow, *et al.* (1985) *Curr. Genet. 10*:380471 Gaillardin, *et al.* (1985) *Curr. Genet. 10*:49].

Methods of introducing exogenous DNA into yeast hosts are well-known in the art, and usually include either the transformation of spheroplasts or of intact yeast cells treated with alkali cations. Transformation procedures usually vary with the yeast species to be transformed. See *eg.* [Kurtz *et al.* (1986) *Mol. Cell. Biol. 6*:142; Kunze *et al.* (1985) *J. Basic Microbiol. 25*:141; Candida]; [Gleeson *et al.* (1986) *J. Gen. Microbiol. 132*:3459; Roggenkamp *et al.* (1986) *Mol. Gen. Genet. 202*:302; Hansenula]; [Das *et al.* (1984) *J. Bacteriol. 158*:1165; De Louvencourt *et al.* (1983) *J. Bacteriol. 154*:1165; Van den Berg *et al.* (1990) *Bio/Technology 8*:135, Kluyveromyces]; [Cregg *et al.* (1985) *Mol. Cell. Biol. 5*:3376; Kunze *et al.* (1985) *J. Basic Microbiol. 25*:141; US Patent Nos. 4,837,148 and 4,929,555; Pichia]; [Hinnen *et al.* (1978) *Proc. Natl. Acad. Sci. USA 75*;1929; Ito *et al.* (1983) *J. Bacteriol. 153*:163 Saccharomyces]; [Beach and Nurse (1981) *Nature 300*:706; Schizosaccharomyces]; [Davidow *et al.* (1985) *Curr. Genet. 10*:39; Gaillardin *et al.* (1985) *Curr. Genet. 10*:49; Yarrowia].

Antibodies

As used herein, the term "antibody" refers to a polypeptide or group of polypeptides composed of at least one antibody combining site. An "antibody combining site" is the three-dimensional binding space with an internal surface shape and charge distribution complementary to the features of an epitope of an antigen, which allows a binding of the antibody with the antigen. "Antibody" includes, for example, vertebrate antibodies, hybrid antibodies, chimeric antibodies, humanised antibodies, altered antibodies, univalent antibodies, Fab proteins, and single domain antibodies.

Antibodies against the proteins of the invention are useful for affinity chromatography, immunoassays, and distinguishing/identifying streptococcus proteins.

Antibodies to the proteins of the invention, both polyclonal and monoclonal, may be prepared by conventional methods. In general, the protein is first used to immunize a suitable animal, preferably a mouse, rat, rabbit or goat. Rabbits and goats are preferred for the preparation of polyclonal sera due to the volume of serum obtainable, and the availability of labeled antirabbit and anti-goat antibodies. Immunization is generally performed by mixing or emulsifying the protein in saline, preferably in an adjuvant such as Freund's complete adjuvant, and injecting the mixture or emulsion parenterally (generally subcutaneously or intramuscularly). A dose of 50-200 μg/injection is typically sufficient. Immunization is generally boosted 2-6 weeks later with one or more injections of the protein in saline, preferably using Freund's incomplete adjuvant. One may alternatively generate antibodies by in vitro immunization using methods known in the art, which for the purposes of this invention is considered equivalent to *in vivo* immunization. Polyclonal antisera is obtained by bleeding the immunized animal into a glass or plastic container, incubating the blood at 25°C for one hour, followed by incubating at 4°C for 2-18 hours. The serum is recovered by centrifugation (*eg.* 1,000*g* for 10 minutes). About 20-50 ml per bleed may be obtained from rabbits.

Monoclonal antibodies are prepared using the standard method of Kohler & Milstein [*Nature* (1975) 256:495-96], or a modification thereof. Typically, a mouse or rat is immunized as described above. However, rather than bleeding the animal to extract serum, the spleen (and optionally several large lymph nodes) is removed and dissociated into single cells. If desired, the

spleen cells may be screened (after removal of nonspecifically adherent cells) by applying a cell suspension to a plate or well coated with the protein antigen. B-cells expressing membrane-bound immunoglobulin specific for the antigen bind to the plate, and are not rinsed away with the rest of the suspension. Resulting B-cells, or all dissociated spleen cells, are then induced to fuse with myeloma cells to form hybridomas, and are cultured in a selective medium (*eg.* hypoxanthine, aminopterin, thymidine medium, "HAT"). The resulting hybridomas are plated by limiting dilution, and are assayed for production of antibodies which bind specifically to the immunizing antigen (and which do not bind to unrelated antigens). The selected MAb-secreting hybridomas are then cultured either *in vitro* (*eg.* in tissue culture bottles or hollow fiber reactors), or *in vivo* (as ascites in mice).

If desired, the antibodies (whether polyclonal or monoclonal) may be labeled using conventional techniques. Suitable labels include fluorophores, chromophores, radioactive atoms (particularly ^{32}P and ^{125}I), electron-dense reagents, enzymes, and ligands having specific binding partners. Enzymes are typically detected by their activity. For example, horseradish peroxidase is usually detected by its ability to convert 3,3',5,5'-tetramethylbenzidine (TMB) to a blue pigment, quantifiable with a spectrophotometer. "Specific binding partner" refers to a protein capable of binding a ligand molecule with high specificity, as for example in the case of an antigen and a monoclonal antibody specific therefor. Other specific binding partners include biotin and avidin or streptavidin, IgG and protein A, and the numerous receptor-ligand couples known in the art. It should be understood that the above description is not meant to categorize the various labels into distinct classes, as the same label may serve in several different modes. For example, ^{125}I may serve as a radioactive label or as an electron-dense reagent. HRP may serve as enzyme or as antigen for a MAb. Further, one may combine various labels for desired effect. For example, MAbs and avidin also require labels in the practice of this invention: thus, one might label a MAb with biotin, and detect its presence with avidin labeled with ^{125}I, or with an anti-biotin MAb labeled with HRP. Other permutations and possibilities will be readily apparent to those of ordinary skill in the art, and are considered as equivalents within the scope of the instant invention.

Pharmaceutical Compositions

Pharmaceutical compositions can comprise either polypeptides, antibodies, or nucleic acid of the invention. The pharmaceutical compositions will comprise a therapeutically effective amount of either polypeptides, antibodies, or polynucleotides of the claimed invention.

The term "therapeutically effective amount" as used herein refers to an amount of a therapeutic agent to treat, ameliorate, or prevent a desired disease or condition, or to exhibit a detectable therapeutic or preventative effect. The effect can be detected by, for example, chemical markers or antigen levels. Therapeutic effects also include reduction in physical symptoms, such as decreased body temperature. The precise effective amount for a subject will depend upon the subject's size and health, the nature and extent of the condition, and the therapeutics or combination of therapeutics selected for administration. Thus, it is not useful to specify an exact effective amount in advance. However, the effective amount for a given situation can be determined by routine experimentation and is within the judgement of the clinician.

For purposes of the present invention, an effective dose will be from about 0.01 mg/ kg to 50 mg/kg or 0.05 mg/kg to about 10 mg/kg of the molecule of the invention in the individual to which it is administered.

A pharmaceutical composition can also contain a pharmaceutically acceptable carrier. The term "pharmaceutically acceptable carrier" refers to a carrier for administration of a therapeutic agent, such as antibodies or a polypeptide, genes, and other therapeutic agents. The term refers to any pharmaceutical carrier that does not itself induce the production of antibodies harmful to the individual receiving the composition, and which may be administered without undue toxicity. Suitable carriers may be large, slowly metabolized macromolecules such as proteins, polysaccharides, polylactic acids, polyglycolic acids, polymeric amino acids, amino acid copolymers, and inactive virus particles. Such carriers are well known to those of ordinary skill in the art.

Pharmaceutically acceptable salts can be used therein, for example, mineral acid salts such as hydrochlorides, hydrobromides, phosphates, sulfates, and the like; and the salts of organic acids such as acetates, propionates, malonates, benzoates, and the like. A thorough discussion of pharmaceutically acceptable excipients is available in Remington's Pharmaceutical Sciences (Mack Pub. Co., N.J. 1991).

Pharmaceutically acceptable carriers in therapeutic compositions may contain liquids such as water, saline, glycerol and ethanol. Additionally, auxiliary substances, such as wetting or emulsifying agents, pH buffering substances, and the like, may be present in such vehicles. Typically, the therapeutic compositions are prepared as injectables, either as liquid solutions or suspensions; solid forms suitable for solution in, or suspension in, liquid vehicles prior to injection may also be prepared. Liposomes are included within the definition of a pharmaceutically acceptable carrier.

Delivery Methods

Once formulated, the compositions of the invention can be administered directly to the subject. The subjects to be treated can be animals; in particular, human subjects can be treated.

Direct delivery of the compositions will generally be accomplished by injection, either subcutaneously, intraperitoneally, intravenously or intramuscularly or delivered to the interstitial space of a tissue. The compositions can also be administered into a lesion. Other modes of administration include oral and pulmonary administration, suppositories, and transdermal or transcutaneous applications (*eg.* see WO98/20734), needles, and gene guns or hyposprays. Dosage treatment may be a single dose schedule or a multiple dose schedule.

Vaccines

Vaccines according to the invention may either be prophylactic (*ie.* to prevent infection) or therapeutic (*ie.* to treat disease after infection).

Such vaccines comprise immunising antigen(s), immunogen(s), polypeptide(s), protein(s) or nucleic acid, usually in combination with "pharmaceutically acceptable carriers," which include any carrier that does not itself induce the production of antibodies harmful to the individual receiving the composition. Suitable carriers are typically large, slowly metabolized macromolecules such as proteins, polysaccharides, polylactic acids, polyglycolic acids, polymeric amino acids, amino acid copolymers, lipid aggregates (such as oil droplets or liposomes), and inactive virus particles. Such carriers are well known to those of ordinary skill in the art. Additionally, these carriers may function as immunostimulating agents ("adjuvants"). Furthermore, the antigen or immunogen may be conjugated to a bacterial toxoid, such as a toxoid from diphtheria, tetanus, cholera, *H. pylori*, *etc.* pathogens.

Preferred adjuvants to enhance effectiveness of the composition include, but are not limited to: (1) oil-in-water emulsion formulations (with or without other specific immunostimulating agents such as muramyl peptides (see below) or bacterial cell wall components), such as for example (a) MF59™ (WO90/14837; Chapter 10 in *Vaccine Design -- the subunit and adjuvant approach* (1995) ed. Powell & Newman), containing 5% Squalene, 0.5% Tween 80, and 0.5% Span 85 (optionally containing MTP-PE) formulated into submicron particles using a microfluidizer, (b) SAF, containing 10% Squalane, 0.4% Tween 80, 5% pluronic-blocked polymer L121, and thr-MDP either microfluidized into a submicron emulsion or vortexed to generate a larger particle size emulsion, and (c) Ribi™ adjuvant system (RAS), (Ribi Immunochem, Hamilton, MT) containing 2% Squalene, 0.2% Tween 80, and one or more bacterial cell wall components from the group consisting of monophosphorylipid A (MPL), trehalose dimycolate (TDM), and cell wall skeleton (CWS), preferably MPL + CWS (Detox™); (2) saponin adjuvants, such as QS21 or Stimulon™ (Cambridge Bioscience, Worcester, MA) may be used or particles generated therefrom such as ISCOMs (immunostimulating complexes), which ISCOMS may be devoid of additional detergent *e.g.* WO00/07621; (3) Complete Freund's Adjuvant (CFA) and Incomplete Freund's Adjuvant (IFA); (4) cytokines, such as interleukins (*e.g.* IL-1, IL-2, IL-4, IL-5, IL-6, IL-7, IL-12 (WO99/44636), *etc.*), interferons (*e.g.* gamma interferon), macrophage colony stimulating factor (M-CSF), tumor necrosis factor (TNF), *etc.*; (5) monophosphoryl lipid A (MPL) or 3-O-deacylated MPL (3dMPL) *e.g.* GB-2220221, EP-A-0689454; (6) combinations of 3dMPL with, for example, QS21 and/or oil-in-water emulsions *e.g.* EP-A-0835318, EP-A-0735898, EP-A-0761231; (7) oligonucleotides comprising CpG motifs [Krieg *Vaccine* 2000, 19, 618-622; Krieg *Curr opin Mol Ther* 2001 3:15-24; Roman *et al.*, *Nat. Med.*, 1997, 3, 849-854; Weiner *et al.*, *PNAS USA*, 1997, 94, 10833-10837; Davis *et al.*, *J. Immunol.*, 1998, 160, 870-876; Chu *et al.*, *J. Exp. Med.*, 1997, 186, 1623-1631; Lipford *et al.*, *Eur. J. Immunol.*, 1997, 27, 2340-2344; Moldoveanu *et al.*, *Vaccine*, 1988, 16, 1216-1224, Krieg *et al.*, *Nature*, 1995, 374, 546-549; Klinman *et al.*, *PNAS USA*, 1996, 93, 2879-2883; Ballas *et al.*, *J. Immunol.*, 1996, 157, 1840-1845; Cowdery *et al.*, *J. Immunol.*, 1996, 156, 4570-4575; Halpern *et al.*, *Cell. Immunol.*, 1996, 167, 72-78; Yamamoto *et al.*, *Jpn. J. Cancer Res.*, 1988, 79, 866-873; Stacey *et al.*, *J. Immunol.*, 1996, 157, 2116-2122; Messina *et al.*, *J. Immunol.*, 1991, 147, 1759-1764; Yi *et al.*, *J. Immunol.*, 1996, 157, 4918-4925; Yi *et al.*, *J. Immunol.*, 1996, 157, 5394-5402; Yi *et al.*, *J. Immunol.*, 1998, 160, 4755-4761; and Yi *et al.*, *J. Immunol.*, 1998, 160, 5898-5906; International patent applications WO96/02555, WO98/16247, WO98/18810, WO98/40100, WO98/55495, WO98/37919 and WO98/52581] *i.e.* containing at least one CG dinucleotide, with 5-methylcytosine optionally being used in place of cytosine; (8) a polyoxyethylene ether or a polyoxyethylene ester *e.g.* WO99/52549; (9) a polyoxyethylene sorbitan ester surfactant in combination with an octoxynol (*e.g.* WO01/21207) or a polyoxyethylene alkyl ether or ester surfactant in combination with at least one additional non-ionic surfactant such as an octoxynol (*e.g.* WO01/21152); (10) an immunostimulatory oligonucleotide (*e.g.* a CpG oligonucleotide) and a saponin *e.g.* WO00/62800; (11) an immunostimulant and a particle of metal salt *e.g.* WO00/23105; (12) a saponin and an oil-in-water emulsion *e.g.* WO99/11241; (13) a saponin (*e.g.* QS21) + 3dMPL + IL-12 (optionally + a sterol) *e.g.* WO98/57659; (14) aluminium salts, preferably hydroxide or phosphate, but any other suitable salt may also be used (*e.g.* hydroxyphosphate, oxyhydroxide, orthophosphate, sulphate *etc.* [*e.g.* see chapters 8 & 9 of Powell & Newman]). Mixtures of different aluminium

salts may also be used. The salt may take any suitable form (*e.g.* gel, crystalline, amorphous *etc.*); (15) other substances that act as immunostimulating agents to enhance the efficacy of the composition. Aluminium salts and/or MF59™ are preferred.

As mentioned above, muramyl peptides include, but are not limited to, N-acetyl-muramyl-L-threonyl-D-isoglutamine (thr-MDP), N-acetyl-normuramyl-L-alanyl-D-isoglutamine (nor-MDP), N-acetylmuramyl-L-alanyl-D-isoglutaminyl-L-alanine-2-(1'-2'-dipalmitoyl-*sn*-glycero-3-hydroxyphosphoryloxy)-ethylamine (MTP-PE), *etc.*

The immunogenic compositions (*eg.* the immunising antigen/immunogen/polypeptide/protein/ nucleic acid, pharmaceutically acceptable carrier, and adjuvant) typically will contain diluents, such as water, saline, glycerol, ethanol, etc. Additionally, auxiliary substances, such as wetting or emulsifying agents, pH buffering substances, and the like, may be present in such vehicles.

Typically, the immunogenic compositions are prepared as injectables, either as liquid solutions or suspensions; solid forms suitable for solution in, or suspension in, liquid vehicles prior to injection may also be prepared. The preparation also may be emulsified or encapsulated in liposomes for enhanced adjuvant effect, as discussed above under pharmaceutically acceptable carriers.

Immunogenic compositions used as vaccines comprise an immunologically effective amount of the antigenic or immunogenic polypeptides, as well as any other of the above-mentioned components, as needed. By "immunologically effective amount", it is meant that the administration of that amount to an individual, either in a single dose or as part of a series, is effective for treatment or prevention. This amount varies depending upon the health and physical condition of the individual to be treated, the taxonomic group of individual to be treated (*eg.* nonhuman primate, primate, *etc.*), the capacity of the individual's immune system to synthesize antibodies, the degree of protection desired, the formulation of the vaccine, the treating doctor's assessment of the medical situation, and other relevant factors. It is expected that the amount will fall in a relatively broad range that can be determined through routine trials.

The immunogenic compositions are conventionally administered parenterally, *eg.* by injection, either subcutaneously, intramuscularly, or transdermally/transcutaneously (*eg.* WO98/20734). Additional formulations suitable for other modes of administration include oral and pulmonary formulations, suppositories, and transdermal applications. Dosage treatment may be a single dose schedule or a multiple dose schedule. The vaccine may be administered in conjunction with other immunoregulatory agents.

As an alternative to protein-based vaccines, DNA vaccination may be used [*eg.* Robinson & Torres (1997) *Seminars in Immunol* 9:271-283; Donnelly *et al.* (1997) *Annu Rev Immunol* 15:617-648; later herein].

Gene Delivery Vehicles

Gene therapy vehicles for delivery of constructs including a coding sequence of a therapeutic of the invention, to be delivered to the mammal for expression in the mammal, can be administered either locally or systemically. These constructs can utilize viral or non-viral vector approaches in *in vivo* or *ex vivo* modality. Expression of such coding sequence can be induced using endogenous mammalian or heterologous promoters. Expression of the coding sequence in vivo can be either constitutive or regulated.

The invention includes gene delivery vehicles capable of expressing the contemplated nucleic acid sequences. The gene delivery vehicle is preferably a viral vector and, more preferably, a retroviral, adenoviral, adeno-associated viral (AAV), herpes viral, or alphavirus vector. The viral vector can also be an astrovirus, coronavirus, orthomyxovirus, papovavirus, paramyxovirus, parvovirus, picornavirus, poxvirus, or togavirus viral vector. See generally, Jolly (1994) *Cancer Gene Therapy* 1:51-64; Kimura (1994) *Human Gene Therapy* 5:845-852; Connelly (1995) *Human Gene Therapy* 6:185-193; and Kaplitt (1994) *Nature Genetics* 6:148-153.

Retroviral vectors are well known in the art and we contemplate that any retroviral gene therapy vector is employable in the invention, including B, C and D type retroviruses, xenotropic retroviruses (for example, NZB-X1, NZB-X2 and NZB9-1 (see ONeill (1985) *J. Virol.* 53:160) polytropic retroviruses *eg.* MCF and MCF-MLV (see Kelly (1983) *J. Virol.* 45:291), spumaviruses and lentiviruses. See RNA Tumor Viruses, Second Edition, Cold Spring Harbor Laboratory, 1985.

Portions of the retroviral gene therapy vector may be derived from different retroviruses. For example, retrovector LTRs may be derived from a Murine Sarcoma Virus, a tRNA binding site from a Rous Sarcoma Virus, a packaging signal from a Murine Leukemia Virus, and an origin of second strand synthesis from an Avian Leukosis Virus.

These recombinant retroviral vectors may be used to generate transduction competent retroviral vector particles by introducing them into appropriate packaging cell lines (see US patent 5,591,624). Retrovirus vectors can be constructed for site-specific integration into host cell DNA by incorporation of a chimeric integrase enzyme into the retroviral particle (see WO96/37626). It is preferable that the recombinant viral vector is a replication defective recombinant virus.

Packaging cell lines suitable for use with the above-described retrovirus vectors are well known in the art, are readily prepared (see WO95/30763 and WO92/05266), and can be used to create producer cell lines (also termed vector cell lines or "VCLs") for the production of recombinant vector particles. Preferably, the packaging cell lines are made from human parent cells (eg. HT1080 cells) or mink parent cell lines, which eliminates inactivation in human serum.

Preferred retroviruses for the construction of retroviral gene therapy vectors include Avian Leukosis Virus, Bovine Leukemia, Virus, Murine Leukemia Virus, Mink-Cell Focus-Inducing Virus, Murine Sarcoma Virus, Reticuloendotheliosis Virus and Rous Sarcoma Virus. Particularly preferred Murine Leukemia Viruses include 4070A and 1504A (Hartley and Rowe (1976) *J Virol* 19:19-25), Abelson (ATCC No. VR-999), Friend (ATCC No. VR-245), Graffi, Gross (ATCC Nol VR-590), Kirsten, Harvey Sarcoma Virus and Rauscher (ATCC No. VR-998) and Moloney Murine Leukemia Virus (ATCC No. VR-190). Such retroviruses may be obtained from depositories or collections such as the American Type Culture Collection ("ATCC") in Rockville, Maryland or isolated from known sources using commonly available techniques.

Exemplary known retroviral gene therapy vectors employable in this invention include those described in patent applications GB2200651, EP0415731, EP0345242, EP0334301, WO89/02468; WO89/05349, WO89/09271, WO90/02806, WO90/07936, WO94/03622, WO93/25698, WO93/25234, WO93/11230, WO93/10218, WO91/02805, WO91/02825, WO95/07994, US 5,219,740, US 4,405,712, US 4,861,719, US 4,980,289, US 4,777,127, US 5,591,624. See also Vile (1993) *Cancer Res* 53:3860-3864; Vile (1993) *Cancer Res* 53:962-967; Ram (1993) *Cancer Res* 53 (1993) 83-88; Takamiya (1992) *J Neurosci Res* 33:493-503; Baba (1993) *J Neurosurg* 79:729-735; Mann (1983) *Cell* 33:153; Cane (1984) *Proc Natl Acad Sci* 81:6349; and Miller (1990) *Human Gene Therapy* 1.

Human adenoviral gene therapy vectors are also known in the art and employable in this invention. See, for example, Berkner (1988) *Biotechniques* 6:616 and Rosenfeld (1991) *Science* 252:431, and WO93/07283, WO93/06223, and WO93/07282. Exemplary known adenoviral gene therapy vectors employable in this invention include those described in the above referenced documents and in WO94/12649, WO93/03769, WO93/19191, WO94/28938, WO95/11984, WO95/00655, WO95/27071, WO95/29993, WO95/34671, WO96/05320, WO94/08026, WO94/11506, WO93/06223, WO94/24299, WO95/14102, WO95/24297, WO95/02697, WO94/28152, WO94/24299, WO95/09241, WO95/25807, WO95/05835, WO94/18922 and WO95/09654. Alternatively, administration of DNA linked to killed adenovirus as described in Curiel (1992) *Hum. Gene Ther.* 3:147-154 may be employed. The gene delivery vehicles of the invention also include adenovirus associated virus (AAV) vectors. Leading and preferred examples of such vectors for use in this invention are the AAV-2 based vectors disclosed in Srivastava, WO93/09239. Most preferred AAV vectors comprise the two AAV inverted terminal repeats in which the native D-sequences are modified by substitution of nucleotides, such that at least 5 native nucleotides and up to 18 native nucleotides, preferably at least 10 native nucleotides up to 18 native nucleotides, most preferably 10 native nucleotides are retained and the remaining nucleotides of the D-sequence are deleted or replaced with non-native nucleotides. The native D-sequences of the AAV inverted terminal repeats are sequences of 20 consecutive nucleotides in each AAV inverted terminal repeat (ie. there is one sequence at each end) which are not involved in HP formation. The non-native replacement nucleotide may be any nucleotide other than the nucleotide found in the native Dsequence in the same position. Other employable exemplary AAV vectors are pWP-19, pWN-1, both of which are disclosed in Nahreini (1993) *Gene* 124:257-262. Another example of such an AAV vector is psub201 (see Samulski (1987) *J. Virol.* 61:3096). Another exemplary AAV vector is the Double-D ITR vector. Construction of the Double-D ITR vector is disclosed in US Patent 5,478,745. Still other vectors are those disclosed in Carter US Patent 4,797,368 and Muzyczka US Patent 5,139,941, Chartejee US Patent 5,474,935, and Kotin WO94/288157. Yet a further example of an AAV vector employable in this invention is SSV9AFABTKneo, which contains the AFP enhancer and albumin promoter and directs expression predominantly in the liver. Its structure and construction are disclosed in Su (1996) *Human Gene Therapy* 7:463-470. Additional AAV gene therapy vectors are described in US 5,354,678, US 5,173,414, US 5,139,941, and US 5,252,479.

The gene therapy vectors of the invention also include herpes vectors. Leading and preferred examples are herpes simplex virus vectors containing a sequence encoding a thymidine kinase polypeptide such as those disclosed in US 5,288,641 and EP0176170 (Roizman). Additional exemplary herpes simplex virus vectors include HFEM/ICP6-LacZ disclosed in WO95/04139 (Wistar Institute), pHSVlac described in Geller (1988) *Science* 241:1667-1669 and in WO90/09441 and WO92/07945, HSV Us3::pgC-lacZ described in Fink (1992) *Human Gene Therapy* 3:11-19 and HSV 7134, 2 RH 105 and GAL4 described in EP 0453242 (Breakefield), and those deposited with the ATCC with accession numbers VR-977 and VR-260.

Also contemplated are alpha virus gene therapy vectors that can be employed in this invention. Preferred alpha virus vectors are Sindbis viruses vectors. Togaviruses, Semliki Forest virus (ATCC VR-67; ATCC VR-1247), Middleberg virus (ATCC

VR-370), Ross River virus (ATCC VR-373; ATCC VR-1246), Venezuelan equine encephalitis virus (ATCC VR923; ATCC VR-1250; ATCC VR-1249; ATCC VR-532), and those described in US patents 5,091,309, 5,217,879, and WO92/10578. More particularly, those alpha virus vectors described in US Serial No. 08/405,627, filed March 15, 1995,WO94/21792, WO92/10578, WO95/07994, US 5,091,309 and US 5,217,879 are employable. Such alpha viruses may be obtained from depositories or collections such as the ATCC in Rockville, Maryland or isolated from known sources using commonly available techniques. Preferably, alphavirus vectors with reduced cytotoxicity are used (see USSN 08/679640).

DNA vector systems such as eukaryotic layered expression systems are also useful for expressing the nucleic acids of the invention. See WO95/07994 for a detailed description of eukaryotic layered expression systems. Preferably, the eukaryotic layered expression systems of the invention are derived from alphavirus vectors and most preferably from Sindbis viral vectors.

Other viral vectors suitable for use in the present invention include those derived from poliovirus, for example ATCC VR-58 and those described in Evans, Nature 339 (1989) 385 and Sabin (1973) *J. Biol. Standardization* 1:115; rhinovirus, for example ATCC VR-1110 and those described in Arnold (1990) *J Cell Biochem* L401; pox viruses such as canary pox virus or vaccinia virus, for example ATCC VR-111 and ATCC VR-2010 and those described in Fisher-Hoch (1989) *Proc Natl Acad Sci* 86:317; Flexner (1989) *Ann NY Acad Sci* 569:86, Flexner (1990) *Vaccine* 8:17; in US 4,603,112 and US 4,769,330 and WO89/01973; SV40 virus, for example ATCC VR-305 and those described in Mulligan (1979) *Nature* 277:108 and Madzak (1992) *J Gen Virol* 73:1533; influenza virus, for example ATCC VR-797 and recombinant influenza viruses made employing reverse genetics techniques as described in US 5,166,057 and in Enami (1990) *Proc Natl Acad Sci* 87:3802-3805; Enami & Palese (1991) *J Virol* 65:2711-2713 and Luytjes (1989) *Cell* 59:110, (see also McMichael (1983) *NEJ Med* 309:13, and Yap (1978) *Nature* 273:238 and *Nature* (1979) 277:108); human immunodeficiency virus as described in EP-0386882 and in Buchschacher (1992) *J. Virol.* 66:2731; measles virus, for example ATCC VR-67 and VR-1247 and those described in EP-0440219; Aura virus, for example ATCC VR-368; Bebaru virus, for example ATCC VR-600 and ATCC VR-1240; Cabassou virus, for example ATCC VR-922; Chikungunya virus, for example ATCC VR-64 and ATCC VR-1241; Fort Morgan Virus, for example ATCC VR-924; Getah virus, for example ATCC VR-369 and ATCC VR-1243; Kyzylagach virus, for example ATCC VR-927; Mayaro virus, for example ATCC VR-66; Mucambo virus, for example ATCC VR-580 and ATCC VR-1244; Ndumu virus, for example ATCC VR-371; Pixuna virus, for example ATCC VR-372 and ATCC VR-1245; Tonate virus, for example ATCC VR-925; Triniti virus, for example ATCC VR-469; Una virus, for example ATCC VR-374; Whataroa virus, for example ATCC VR-926; Y-62-33 virus, for example ATCC VR-375; O'Nyong virus, Eastern encephalitis virus, for example ATCC VR-65 and ATCC VR-1242; Western encephalitis virus, for example ATCC VR-70, ATCC VR-1251, ATCC VR-622 and ATCC VR-1252; and coronavirus, for example ATCC VR-740 and those described in Hamre (1966) *Proc Soc Exp Biol Med* 121:190.

Delivery of the compositions of this invention into cells is not limited to the above mentioned viral vectors. Other delivery methods and media may be employed such as, for example, nucleic acid expression vectors, polycationic condensed DNA linked or unlinked to killed adenovirus alone, for example see US Serial No. 08/366,787, filed December 30, 1994 and Curiel (1992) *Hum Gene Ther* 3:147-154 ligand linked DNA, for example see Wu (1989) *J Biol Chem* 264:16985-16987, eucaryotic cell delivery vehicles cells, for example see US Serial No.08/240,030, filed May 9, 1994, and US Serial No. 08/404,796, deposition of photopolymerized hydrogel materials, hand-held gene transfer particle gun, as described in US Patent 5,149,655, ionizing radiation as described in US5,206,152 and in WO92/11033, nucleic charge neutralization or fusion with cell membranes. Additional approaches are described in Philip (1994) *Mol Cell Biol* 14:2411-2418 and in Woffendin (1994) *Proc Natl Acad Sci* 91:1581-1585.

Particle mediated gene transfer may be employed, for example see US Serial No. 60/023,867. Briefly, the sequence can be inserted into conventional vectors that contain conventional control sequences for high level expression, and then incubated with synthetic gene transfer molecules such as polymeric DNA-binding cations like polylysine, protamine, and albumin, linked to cell targeting ligands such as asialoorosomucoid, as described in Wu & Wu (1987) *J. Biol. Chem.* 262:4429-4432, insulin as described in Hucked (1990) *Biochem Pharmacol* 40:253-263, galactose as described in Plank (1992) *Bioconjugate Chem* 3:533-539, lactose or transferrin.

Naked DNA may also be employed. Exemplary naked DNA introduction methods are described in WO 90/11092 and US 5,580,859. Uptake efficiency may be improved using biodegradable latex beads. DNA coated latex beads are efficiently transported into cells after endocytosis initiation by the beads. The method may be improved further by treatment of the beads to increase hydrophobicity and thereby facilitate disruption of the endosome and release of the DNA into the cytoplasm.

Liposomes that can act as gene delivery vehicles are described in US 5,422,120, WO95/13796, WO94/23697, WO91/14445 and EP-524,968. As described in USSN. 60/023,867, on non-viral delivery, the nucleic acid sequences encoding a polypeptide

can be inserted into conventional vectors that contain conventional control sequences for high level expression, and then be incubated with synthetic gene transfer molecules such as polymeric DNA-binding cations like polylysine, protamine, and albumin, linked to cell targeting ligands such as asialoorosomucoid, insulin, galactose, lactose, or transferrin. Other delivery systems include the use of liposomes to encapsulate DNA comprising the gene under the control of a variety of tissue-specific or ubiquitously-active promoters. Further non-viral delivery suitable for use includes mechanical delivery systems such as the approach described in Woffendin *et al* (1994) *Proc. Natl. Acad. Sci. USA* 91(24):11581-11585. Moreover, the coding sequence and the product of expression of such can be delivered through deposition of photopolymerized hydrogel materials. Other conventional methods for gene delivery that can be used for delivery of the coding sequence include, for example, use of hand-held gene transfer particle gun, as described in US 5,149,655; use of ionizing radiation for activating transferred gene, as described in US 5,206,152 and WO92/11033

Exemplary liposome and polycationic gene delivery vehicles are those described in US 5,422,120 and 4,762,915; in WO 95/13796; WO94/23697; and WO91/14445; in EP-0524968; and in Stryer, Biochemistry, pages 236-240 (1975) W.H. Freeman, San Francisco; Szoka (1980) *Biochem Biophys Acta* 600:1; Bayer (1979) *Biochem Biophys Acta* 550:464; Rivnay (1987) *Meth Enzymol* 149:119; Wang (1987) *Proc Natl Acad Sci* 84:7851; Plant (1989) *Anal Biochem* 176:420.

A polynucleotide composition can comprises therapeutically effective amount of a gene therapy vehicle, as the term is defined above. For purposes of the present invention, an effective dose will be from about 0.01 mg/ kg to 50 mg/kg or 0.05 mg/kg to about 10 mg/kg of the DNA constructs in the individual to which it is administered.

Delivery Methods

Once formulated, the polynucleotide compositions of the invention can be administered (1) directly to the subject; (2) delivered *ex vivo*, to cells derived from the subject; or (3) *in vitro* for expression of recombinant proteins. The subjects to be treated can be mammals or birds. Also, human subjects can be treated.

Direct delivery of the compositions will generally be accomplished by injection, either subcutaneously, intraperitoneally, intravenously or intramuscularly or delivered to the interstitial space of a tissue. The compositions can also be administered into a lesion. Other modes of administration include oral and pulmonary administration, suppositories, and transdermal or transcutaneous applications (*eg.* see WO98/20734), needles, and gene guns or hyposprays. Dosage treatment may be a single dose schedule or a multiple dose schedule.

Methods for the *ex vivo* delivery and reimplantation of transformed cells into a subject are known in the art and described in *eg.* WO93/14778. Examples of cells useful in ex vivo applications include, for example, stem cells, particularly hematopoetic, lymph cells, macrophages, dendritic cells, or tumor cells.

Generally, delivery of nucleic acids for both *ex vivo* and *in vitro* applications can be accomplished by the following procedures, for example, dextran-mediated transfection, calcium phosphate precipitation, polybrene mediated transfection, protoplast fusion, electroporation, encapsulation of the polynucleotide(s) in liposomes, and direct microinjection of the DNA into nuclei, all well known in the art.

Polynucleotide and polypeptide pharmaceutical compositions

In addition to the pharmaceutically acceptable carriers and salts described above, the following additional agents can be used with polynucleotide and/or polypeptide compositions.

A.Polypeptides

One example are polypeptides which include, without limitation: asioloorosomucoid (ASOR); transferrin; asialoglycoproteins; antibodies; antibody fragments; ferritin; interleukins; interferons, granulocyte, macrophage colony stimulating factor (GM-CSF), granulocyte colony stimulating factor (G-CSF), macrophage colony stimulating factor (M-CSF), stem cell factor and erythropoietin. Viral antigens, such as envelope proteins, can also be used. Also, proteins from other invasive organisms, such as the 17 amino acid peptide from the circumsporozoite protein of plasmodium falciparum known as RII.

B.Hormones, Vitamins, *etc.*

Other groups that can be included are, for example: hormones, steroids, androgens, estrogens, thyroid hormone, or vitamins, folic acid.

C.Polyalkylenes, Polysaccharides, *etc.*

Also, polyalkylene glycol can be included with the desired polynucleotides/polypeptides. In a preferred embodiment, the polyalkylene glycol is polyethylene glycol. In addition, mono-, di-, or polysaccharides can be included. In a preferred embodiment of this aspect, the polysaccharide is dextran or DEAE-dextran. Also, chitosan and poly(lactide-co-glycolide)

D.Lipids, and Liposomes

The desired polynucleotide/polypeptide can also be encapsulated in lipids or packaged in liposomes prior to delivery to the subject or to cells derived therefrom.

Lipid encapsulation is generally accomplished using liposomes which are able to stably bind or entrap and retain nucleic acid. The ratio of condensed polynucleotide to lipid preparation can vary but will generally be around 1:1 (mg DNA:micromoles lipid), or more of lipid. For a review of the use of liposomes as carriers for delivery of nucleic acids, see, Hug and Sleight (1991).*Biochim. Biophys. Acta.* 1097:1-17; Straubinger (1983) *Meth. Enzymol.* 101:512-527.

Liposomal preparations for use in the present invention include cationic (positively charged), anionic (negatively charged) and neutral preparations. Cationic liposomes have been shown to mediate intracellular delivery of plasmid DNA (Felgner (1987) *Proc. Natl. Acad. Sci. USA* 84:7413-7416); mRNA (Malone (1989) *Proc. Natl. Acad. Sci. USA* 86:6077-6081); and purified transcription factors (Debs (1990) *J. Biol. Chem.* 265:10189-10192), in functional form.

Cationic liposomes are readily available. For example, N[1-2,3-dioleyloxy)propyl]-N,N,N-trithylammonium (DOTMA) liposomes are available under the trademark Lipofectin, from GIBCO BRL, Grand Island, NY. (See, also, Felgner *supra*). Other commercially available liposomes include transfectace (DDAB/DOPE) and DOTAP/DOPE (Boerhinger). Other cationic liposomes can be prepared from readily available materials using techniques well known in the art. See, *eg.* Szoka (1978) *Proc. Natl. Acad. Sci. USA* 75:4194-4198; WO90/11092 for a description of the synthesis of DOTAP (1,2-bis(oleoyloxy)-3-(trimethylammonio)propane) liposomes.

Similarly, anionic and neutral liposomes are readily available, such as from Avanti Polar Lipids (Birmingham, AL), or can be easily prepared using readily available materials. Such materials include phosphatidyl choline, cholesterol, phosphatidyl ethanolamine, dioleoylphosphatidyl choline (DOPC), dioleoylphosphatidyl glycerol (DOPG), dioleoylphoshatidyl ethanolamine (DOPE), among others. These materials can also be mixed with the DOTMA and DOTAP starting materials in appropriate ratios. Methods for making liposomes using these materials are well known in the art.

The liposomes can comprise multilammelar vesicles (MLVs), small unilamellar vesicles (SUVs), or large unilamellar vesicles (LUVs). The various liposome-nucleic acid complexes are prepared using methods known in the art. See *eg.* Straubinger (1983) *Meth. Immunol.* 101:512-527; Szoka (1978) *Proc. Natl. Acad. Sci. USA* 75:4194-4198; Papahadjopoulos (1975) *Biochim. Biophys. Acta* 394:483; Wilson (1979) *Cell* 17:77); Deamer & Bangham (1976) *Biochim. Biophys. Acta* 443:629; Ostro (1977) *Biochem. Biophys. Res. Commun.* 76:836; Fraley (1979) *Proc. Natl. Acad. Sci. USA* 76:3348); Enoch & Strittmatter (1979) *Proc. Natl. Acad. Sci. USA* 76:145; Fraley (1980) *J. Biol. Chem.* (1980) 255:10431; Szoka & Papahadjopoulos (1978) *Proc. Natl. Acad. Sci. USA* 75:145; and Schaefer-Ridder (1982) *Science* 215:166.

E.Lipoproteins

In addition, lipoproteins can be included with the polynucleotide/polypeptide to be delivered. Examples of lipoproteins to be utilized include: chylomicrons, HDL, IDL, LDL, and VLDL. Mutants, fragments, or fusions of these proteins can also be used. Also, modifications of naturally occurring lipoproteins can be used, such as acetylated LDL. These lipoproteins can target the delivery of polynucleotides to cells expressing lipoprotein receptors. Preferably, if lipoproteins are including with the polynucleotide to be delivered, no other targeting ligand is included in the composition.

Naturally occurring lipoproteins comprise a lipid and a protein portion. The protein portion are known as apoproteins. At the present, apoproteins A, B, C, D, and E have been isolated and identified. At least two of these contain several proteins, designated by Roman numerals, AI, AII, AIV; CI, CII, CIII.

A lipoprotein can comprise more than one apoprotein. For example, naturally occurring chylomicrons comprises of A, B, C & E, over time these lipoproteins lose A and acquire C & E. VLDL comprises A, B, C & E apoproteins, LDL comprises apoprotein B; and HDL comprises apoproteins A, C, & E.

The amino acid of these apoproteins are known and are described in, for example, Breslow (1985) Annu Rev. Biochem 54:699; Law (1986) Adv. Exp Med. Biol. 151:162; Chen (1986) J Biol Chem 261:12918; Kane (1980) Proc Natl Acad Sci USA 77:2465; and Utermann (1984) Hum Genet 65:232.

Lipoproteins contain a variety of lipids including, triglycerides, cholesterol (free and esters), and phospholipids. The composition of the lipids varies in naturally occurring lipoproteins. For example, chylomicrons comprise mainly triglycerides. A more detailed description of the lipid content of naturally occurring lipoproteins can be found, for example, in *Meth. Enzymol.* 128 (1986). The composition of the lipids are chosen to aid in conformation of the apoprotein for receptor binding activity. The composition of lipids can also be chosen to facilitate hydrophobic interaction and association with the polynucleotide binding molecule.

Naturally occurring lipoproteins can be isolated from serum by ultracentrifugation, for instance. Such methods are described in *Meth. Enzymol.* (*supra*); Pitas (1980) *J. Biochem.* 255:5454-5460 and Mahey (1979) *J Clin. Invest* 64:743-750. Lipoproteins can also be produced by *in vitro* or recombinant methods by expression of the apoprotein genes in a desired host cell. See, for example, Atkinson (1986) *Annu Rev Biophys Chem* 15:403 and Radding (1958) *Biochim Biophys Acta* 30: 443. Lipoproteins can also be purchased from commercial suppliers, such as Biomedical Technologies, Inc., Stoughton, MA, USA. Further description of lipoproteins can be found in WO98/06437..

F.Polycationic Agents

Polycationic agents can be included, with or without lipoprotein, in a composition with the desired polynucleotide/polypeptide to be delivered.

Polycationic agents, typically, exhibit a net positive charge at physiological relevant pH and are capable of neutralizing the electrical charge of nucleic acids to facilitate delivery to a desired location. These agents have both in vitro, ex vivo, and in vivo applications. Polycationic agents can be used to deliver nucleic acids to a living subject either intramuscularly, subcutaneously, *etc.*

The following are examples of useful polypeptides as polycationic agents: polylysine, polyarginine, polyornithine, and protamine. Other examples include histones, protamines, human serum albumin, DNA binding proteins, non-histone chromosomal proteins, coat proteins from DNA viruses, such as (X174, transcriptional factors also contain domains that bind DNA and therefore may be useful as nucleic aid condensing agents. Briefly, transcriptional factors such as C/CEBP, ejun, o-fos, AP-1, AP-2, AP-3, CPF, Prot-1, Sp-1, Oct-1, Oct-2, CREP, and TFIID contain basic domains that bind DNA sequences.

Organic polycationic agents include: spermine, spermidine, and purtrescine.

The dimensions and of the physical properties of a polycationic agent can be extrapolated from the list above, to construct other polypeptide polycationic agents or to produce synthetic polycationic agents.

Synthetic polycationic agents which are useful include, for example, DEAE-dextran, polybrene. Lipofectin™, and lipofectAMINE™ are monomers that form polycationic complexes when combined with polynucleotides/polypeptides.

Immunodiagnostic Assays

Streptococcus antigens of the invention can be used in immunoassays to detect antibody levels (or, conversely, anti-streptococcus antibodies can be used to detect antigen levels). Immunoassays based on well defined, recombinant antigens can be developed to replace invasive diagnostics methods. Antibodies to streptococcus proteins within biological samples, including for example, blood or serum samples, can be detected. Design of the immunoassays is subject to a great deal of variation, and a variety of these are known in the art. Protocols for the immunoassay may be based, for example, upon competition, or direct reaction, or sandwich type assays. Protocols may also, for example, use solid supports, or may be by immunoprecipitation. Most assays involve the use of labeled antibody or polypeptide; the labels may be, for example, fluorescent, chemiluminescent, radioactive, or dye molecules. Assays which amplify the signals from the probe are also known; examples of which are assays which utilize biotin and avidin, and enzyme-labeled and mediated immunoassays, such as ELISA assays.

Kits suitable for immunodiagnosis and containing the appropriate labeled reagents are constructed by packaging the appropriate materials, including the compositions of the invention, in suitable containers, along with the remaining reagents and materials (for example, suitable buffers, salt solutions, *etc.*) required for the conduct of the assay, as well as suitable set of assay instructions.

Nucleic Acid Hybridisation

"Hybridization" refers to the association of two nucleic acid sequences to one another by hydrogen bonding. Typically, one sequence will be fixed to a solid support and the other will be free in solution. Then, the two sequences will be placed in contact with one another under conditions that favor hydrogen bonding. Factors that affect this bonding include: the type and volume of solvent; reaction temperature; time of hybridization; agitation; agents to block the non-specific attachment of the liquid phase sequence to the solid support (Denhardt's reagent or BLOTTO); concentration of the sequences; use of compounds to increase the rate of association of sequences (dextran sulfate or polyethylene glycol); and the stringency of the washing conditions following hybridization. See Sambrook *et al.* [*supra*] Volume 2, chapter 9, pages 9.47 to 9.57.

"Stringency" refers to conditions in a hybridization reaction that favor association of very similar sequences over sequences that differ. For example, the combination of temperature and salt concentration should be chosen that is approximately 120 to 200°C below the calculated Tm of the hybrid under study. The temperature and salt conditions can often be determined empirically in preliminary experiments in which samples of genomic DNA immobilized on filters are hybridized to the sequence of interest and then washed under conditions of different stringencies. See Sambrook *et al.* at page 9.50.

Variables to consider when performing, for example, a Southern blot are (1) the complexity of the DNA being blotted and (2) the homology between the probe and the sequences being detected. The total amount of the fragment(s) to be studied can vary a magnitude of 10, from 0.1 to 1µg for a plasmid or phage digest to 10^{-9} to 10^{-8} g for a single copy gene in a highly complex eukaryotic genome. For lower complexity polynucleotides, substantially shorter blotting, hybridization, and exposure times, a smaller amount of starting polynucleotides, and lower specific activity of probes can be used. For example, a single-copy yeast gene can be detected with an exposure time of only 1 hour starting with 1 µg of yeast DNA, blotting for two hours, and hybridizing for 4-8 hours with a probe of 10^8 cpm/µg. For a single-copy mammalian gene a conservative approach would start with 10 µg of DNA, blot overnight, and hybridize overnight in the presence of 10% dextran sulfate using a probe of greater than 10^8 cpm/µg, resulting in an exposure time of ~24 hours.

Several factors can affect the melting temperature (Tm) of a DNA-DNA hybrid between the probe and the fragment of interest, and consequently, the appropriate conditions for hybridization and washing. In many cases the probe is not 100% homologous to the fragment. Other commonly encountered variables include the length and total G+C content of the hybridizing sequences and the ionic strength and formamide content of the hybridization buffer. The effects of all of these factors can be approximated by a single equation:

$$Tm = 81 + 16.6(\log_{10}Ci) + 0.4[\%(G + C)] - 0.6(\%formamide) - 600/n - 1.5(\%mismatch).$$

where Ci is the salt concentration (monovalent ions) and n is the length of the hybrid in base pairs (slightly modified from Meinkoth & Wahl (1984) *Anal. Biochem.* 138: 267-284).

In designing a hybridization experiment, some factors affecting nucleic acid hybridization can be conveniently altered. The temperature of the hybridization and washes and the salt concentration during the washes are the simplest to adjust. As the temperature of the hybridization increases (*ie.* stringency), it becomes less likely for hybridization to occur between strands that are nonhomologous, and as a result, background decreases. If the radiolabeled probe is not completely homologous with the immobilized fragment (as is frequently the case in gene family and interspecies hybridization experiments), the hybridization temperature must be reduced, and background will increase. The temperature of the washes affects the intensity of the hybridizing band and the degree of background in a similar manner. The stringency of the washes is also increased with decreasing salt concentrations.

In general, convenient hybridization temperatures in the presence of 50% formamide are 42°C for a probe with is 95% to 100% homologous to the target fragment, 37°C for 90% to 95% homology, and 32°C for 85% to 90% homology. For lower homologies, formamide content should be lowered and temperature adjusted accordingly, using the equation above. If the homology between the probe and the target fragment are not known, the simplest approach is to start with both hybridization and wash conditions which are nonstringent. If non-specific bands or high background are observed after autoradiography, the filter can be washed at high stringency and reexposed. If the time required for exposure makes this approach impractical, several hybridization and/or washing stringencies should be tested in parallel.

Nucleic Acid Probe Assays

Methods such as PCR, branched DNA probe assays, or blotting techniques utilizing nucleic acid probes according to the invention can determine the presence of cDNA or mRNA. A probe is said to "hybridize" with a sequence of the invention if it can form a duplex or double stranded complex, which is stable enough to be detected.

The nucleic acid probes will hybridize to the streptococcus nucleotide sequences of the invention (including both sense and antisense strands). Though many different nucleotide sequences will encode the amino acid sequence, the native streptococcus sequence is preferred because it is the actual sequence present in cells. mRNA represents a coding sequence and so a probe should be complementary to the coding sequence; single-stranded cDNA is complementary to mRNA, and so a cDNA probe should be complementary to the non-coding sequence.

The probe sequence need not be identical to the streptococcus sequence (or its complement) — some variation in the sequence and length can lead to increased assay sensitivity if the nucleic acid probe can form a duplex with target nucleotides, which can be detected. Also, the nucleic acid probe can include additional nucleotides to stabilize the formed duplex. Additional streptococcus sequence may also be helpful as a label to detect the formed duplex. For example, a non-complementary nucleotide sequence

may be attached to the 5' end of the probe, with the remainder of the probe sequence being complementary to a streptococcus sequence. Alternatively, non-complementary bases or longer sequences can be interspersed into the probe, provided that the probe sequence has sufficient complementarity with the a streptococcus sequence in order to hybridize therewith and thereby form a duplex which can be detected.

The exact length and sequence of the probe will depend on the hybridization conditions (*e.g.* temperature, salt condition *etc.*). For example, for diagnostic applications, depending on the complexity of the analyte sequence, the nucleic acid probe typically contains at least 10-20 nucleotides, preferably 15-25, and more preferably at least 30 nucleotides, although it may be shorter than this. Short primers generally require cooler temperatures to form sufficiently stable hybrid complexes with the template.

Probes may be produced by synthetic procedures, such as the triester method of Matteucci *et al.* [*J. Am. Chem. Soc.* (1981) 103:3185], or according to Urdea *et al.* [*Proc. Natl. Acad. Sci. USA* (1983) 80: 7461], or using commercially available automated oligonucleotide synthesizers.

The chemical nature of the probe can be selected according to preference. For certain applications, DNA or RNA are appropriate. For other applications, modifications may be incorporated *eg.* backbone modifications, such as phosphorothioates or methylphosphonates, can be used to increase *in vivo* half-life, alter RNA affinity, increase nuclease resistance *etc.* [*eg.* see Agrawal & Iyer (1995) *Curr Opin Biotechnol* 6:12-19; Agrawal (1996) *TIBTECH* 14:376-387]; analogues such as peptide nucleic acids may also be used [*eg.* see Corey (1997) *TIBTECH* 15:224-229; Buchardt *et al.* (1993) *TIBTECH* 11:384-386].

Alternatively, the polymerase chain reaction (PCR) is another well-known means for detecting small amounts of target nucleic acid. The assay is described in Mullis *et al.* [*Meth. Enzymol.* (1987) 155:335-350] & US patents 4,683,195 & 4,683,202. Two "primer" nucleotides hybridize with the target nucleic acids and are used to prime the reaction. The primers can comprise sequence that does not hybridize to the sequence of the amplification target (or its complement) to aid with duplex stability or, for example, to incorporate a convenient restriction site. Typically, such sequence will flank the desired streptococcus sequence.

A thermostable polymerase creates copies of target nucleic acids from the primers using the original target nucleic acids as a template. After a threshold amount of target nucleic acids are generated by the polymerase, they can be detected by more traditional methods, such as Southern blots. When using the Southern blot method, the labelled probe will hybridize to the streptococcus sequence (or its complement).

Also, mRNA or cDNA can be detected by traditional blotting techniques described in Sambrook *et al* [*supra*]. mRNA, or cDNA generated from mRNA using a polymerase enzyme, can be purified and separated using gel electrophoresis. The nucleic acids on the gel are then blotted onto a solid support, such as nitrocellulose. The solid support is exposed to a labelled probe and then washed to remove any unhybridized probe. Next, the duplexes containing the labeled probe are detected. Typically, the probe is labelled with a radioactive moiety.

BRIEF DESCRIPTION OF DRAWINGS

Figures 1 to **85, 119** to **188, 238** and **239** show SDS-PAGE analysis of total cell extracts from cultures of recombinant *E.coli* expressing GBS proteins of the invention. Lane 1 in each gel (except for Figure 185) contains molecular weight markers. These are 94, 67, 43, 30, 20.1 & 14.4 kDa (except for Figures 7, 8, 10, 11, 13, 14, 15 and 119-170, which use 250, 150, **100**, 75, 50, 37, 25, 15 & 10 kDa).

Figure 86A shows the pDEST15 vector and **Figure 86B** shows the pDEST17-1 vector.

Figures 88 to **118** and **247** to **319** show protein characterisation data for various proteins of the invention.

Figures 189 to **237** and **240** to **246** show SDS-PAGE analysis of purified GBS proteins of the invention. The left-hand lane contains molecular weight markers. These are 94, 67, 43, 30, 20.1 & 14.4 kDa.

MODES FOR CARRYING OUT THE INVENTION

The following examples describe nucleic acid sequences which have been identified in *Streptococcus*, along with their inferred translation products. The examples are generally in the following format:

- a nucleotide sequence which has been identified in *Streptococcus*
- the inferred translation product of this sequence
- a computer analysis (*e.g.* PSORT output) of the translation product, indicating antigenicity

Most examples describe nucleotide sequences from *S.agalactiae*. The specific strain which was sequenced was from serotype V, and is a clinical strain isolated in Italy which expresses the R antigen (ISS/Rome/Italy collection, strain.2603 V/R). For several of these examples, the corresponding sequences from *S.pyogenes* are also given. Where GBS and GAS show homology in this way, there is conservation between species which suggests an essential function and also gives good cross-species reactivity.

In contrast, several examples describe nucleotide sequences from GAS for which no homolog in GBS has been identified. This lack of homology gives molecules which are useful for distinguishing GAS from GBS and for making GAS-specific products. The same is true for GBS sequences which lack GAS homologs *e.g.* these are useful for making GBS-specific products.

The examples typically include details of homology to sequences in the public databases. Proteins that are similar in sequence are generally similar in both structure and function, and the homology often indicates a common evolutionary origin. Comparison with sequences of proteins of known function is widely used as a guide for the assignment of putative protein function to a new sequence and has proved particularly useful in whole-genome analyses.

Various tests can be used to assess the *in vivo* immunogenicity of the proteins identified in the examples. For example, the proteins can be expressed recombinantly and used to screen patient sera by immunoblot. A positive reaction between the protein and patient serum indicates that the patient has previously mounted an immune response to the protein in question *i.e.* the protein is an immunogen. This method can also be used to identify immunodominant proteins. The mouse model used in the examples can also be used.

The recombinant protein can also be conveniently used to prepare antibodies *e.g.* in a mouse. These can be used for direct confirmation that a protein is located on the cell-surface. Labelled antibody (*e.g.* fluorescent labelling for FACS) can be incubated with intact bacteria and the presence of label on the bacterial surface confirms the location of the protein.

For many GBS proteins, the following data are given:

- SDS-PAGE analysis of total recombinant *E.coli* cell extracts for GBS protein expression
- SDS-PAGE analysis after the protein purification

- Western-blot analysis of GBS total cell extract using antisera raised against recombinant proteins
- FACS and ELISA analysis against GBS using antisera raise against recombinant proteins
- Results of the *in vivo* passive protection assay

Details of experimental techniques used are presented below:

Sequence analysis

Open reading frames (ORFs) within nucleotide sequences were predicted using the GLIMMER program [Salzberg *et al.* (1998) *Nucleic Acids Res* 26:544-8]. Where necessary, start codons were modified and corrected manually on the basis of the presence of ribosome-binding sites and promoter regions on the upstream DNA sequence.

ORFs were then screened against the non-redundant protein databases using the programs BLASTp [Altschul *et al.* (1990) *J. Mol. Biol.* 215:403-410] and PRAZE, a modification of the Smith-Waterman algorithm [Smith & Waterman (1981) *J Mol Biol* 147:195-7; see Fleischmann *et al* (1995) *Science* 269:496-512].

Leader peptides within the ORFs were located using three different approaches: (i) PSORT [Nakai (1991) *Bull. Inst. Chem. Res., Kyoto Univ.* 69:269-291; Horton & Nakai (1996) *Intellig. Syst. Mol. Biol.* 4:109-115; Horton & Nakai (1997) *Intellig. Syst. Mol. Biol.* 5:147-152]; (ii) SignalP [Nielsen & Krogh (1998) in *Proceedings of the Sixth International Conference on Intelligent Systems for Molecular Biology* (*ISMB* 6), AAAI Press, Menlo Park, California, pp. 122-130; Nielsen *et al.* (1999) *Protein Engineering* 12:3-9; Nielsen *et al.* (1997). *Int. J. Neural Sys.* 8:581-599]; and (iii) visual inspection of the ORF sequences. Where a signal sequences is given a "possible site" value, the value represents the C-terminus residue of the signal peptide *e.g.* a "possible site" of 26 means that the signal sequence consists of amino acids 1-26.

Lipoprotein-specific signal peptides were located using three different approaches: (i) PSORT [see above]; (ii) the "prokaryotic membrane lipoprotein lipid attachment site" PROSITE motif [Hofmann *et al.* (1999) *Nucleic Acids Res.* 27:215-219; Bucher & Bairoch (1994) in *Proceedings 2nd International Conference on Intelligent Systems for Molecular Biology* (ISMB-94), AAAI Press, pages 53-61]; and (iii) the FINDPATTERNS program available in the GCG Wisconsin Package, using the pattern `(M,L,V)x{9,35}LxxCx`.

Transmembrane domains were located using two approaches: (i) PSORT [see above]; (ii) TopPred [von Heijne (1992) *J. Mol. Biol.* 225:487-494].

LPXTG motifs, characteristic of cell-wall attached proteins in Gram-positive bacteria [Fischetti *et al.* (1990) *Mol Microbiol* 4:1603-5] were located with FINDPATTERNS using the pattern `(L,I,V,M,Y,F)Px(T,A,S,G)(G,N,S,T,A,L)`.

RGD motifs, characteristic of cell-adhesion molecules [D'Souza *et al.* (1991) *Trends Biochem Sci* 16:246-50] were located using FINDPATTERNS.

Enzymes belonging to the glycolytic pathway were also selected as antigens, because these have been found experimentally expressed on the surface of *Streptococci* [*e.g.* Pancholi & Fischetti (1992) *J Exp Med* 176:415-26; Pancholi & Fischetti (1998) *J Biol Chem* 273:14503-15].

Cloning, expression and purification of proteins

GBS genes were cloned to facilitate expression in *E.coli* as two different types of fusion proteins:

a) proteins having a hexa-histidine tag at the amino-terminus (His-gbs)

b) proteins having a GST fusion partner at the amino-terminus (Gst-gbs)

Cloning was performed using the Gateway™ technology (Life Technologies), which is based on the site-specific recombination reactions that mediate integration and excision of phage lambda into and from the *E.coli* genome. A single cloning experiment included the following steps:

1- Amplification of GBS chromosomal DNA to obtain a PCR product coding for a single ORF flanked by *att*B recombination sites.

2- Insertion of the PCR product into a pDONR vector (containing *att*P sites) through a BP reaction (*att*B x *att*P sites). This reaction gives a so called 'pEntry' vector, which now contains *att*L sites flanking the insert.

3- Insertion of the GBS gene into *E.coli* expression vectors (pDestination vectors, containing *att*R sites) through a LR reaction between pEntry and pDestination plasmids (*att*L x *att*R sites).

A) Chromosomal DNA preparation

For chromosomal DNA preparation, GBS strain 2603 V/R (Istituto Superiore Sanità, Rome) was grown to exponential phase in 2 litres TH Broth (Difco) at 37°C, harvested by centrifugation, and dissolved in 40 ml TES (50 mM Tris pH 8, 5 mM EDTA pH 8, 20% sucrose). After addition of 2.5 ml lysozyme solution (25 mg/ml in TES) and 0.5 ml mutanolysin (Sigma M-9901, 25000U/ml in H_2O), the suspension was incubated at 37°C for 1 hour. 1 ml RNase (20 mg/ml) and 0.1 ml proteinase K (20 mg/ml) were added and incubation was continued for 30 min. at 37°C.

Cell lysis was obtained by adding 5 ml sarkosyl solution (10% N-laurylsarcosine in 250 mM EDTA pH 8.0), and incubating 1 hour at 37°C with frequent inversion. After sequential extraction with phenol, phenol-chloroform and chloroform, DNA was precipitated with 0.3M sodium acetate pH 5.2 and 2 volumes of absolute ethanol. The DNA pellet was rinsed with 70% ethanol and dissolved in TE buffer (10 mM Tris-HCl, 1 mM EDTA, pH 8). DNA concentration was evaluated by OD_{260}.

B) Oligonucleotide design

Synthetic oligonucleotide primers were designed on the basis of the coding sequence of each ORF. The aim was to express the protein's extracellular region. Accordingly, predicted signal peptides were omitted (by deducing the 5' end amplification primer sequence immediately downstream from the predicted leader sequence) and C-terminal cell-wall anchoring regions were removed (*e.g.* LPXTG motifs and downstream amino acids). Where additional nucleotides have been deleted, this is indicated by the suffix 'd' (*e.g.* GBS352d' – see Table V). Conversely, a suffix 'L' refers to expression without these deletions. Deletions of C- or N-terminal residues were also sometimes made, as indicated by a 'C' or 'N' suffix.

The amino acid sequences of the expressed GBS proteins (including 'd' and 'L' forms *etc.*) are definitively defined by the sequences of the oligonuclotide primers given in Table II.

5' tails of forward primers and 3' tails of reverse primers included *att*B1 and *att*B2 sites respectively:

Forward primers: 5'-GGGGACAAGTTTGTACAAAAAAGCAGGCTCT-ORF in frame-3' (the TCT sequence preceding the ORF was omitted when the ORF's first coding triplet began with T).

Reverse primers: 5'-GGGGACCACTTTGTACAAGAAAGCTGGGTT-ORF reverse complement-3'.

The number of nucleotides which hybridized to the sequence to be amplified depended on the melting temperature of the primers, which was determined as described by Breslauer *et al.* [*PNAS USA* (1986) 83:3746-50]. The average melting temperature of the selected oligos was 50-55°C for the hybridizing region and 80-85°C for the whole oligos.

C) Amplification

The standard PCR protocol was as follows: 50 ng genomic DNA were used as template in the presence of 0.5 µM each primer, 200 µM each dNTP, 1.5 mM $MgCl_2$, 1x buffer minus Mg^{++} (Gibco-BRL) and 2 units of Taq DNA polymerase (Platinum Taq, Gibco-BRL) in a final volume of 100 µl. Each sample underwent a double-step of amplification: 5 cycles performed using as the hybridizing temperature 50°C, followed by 25 cycles at 68°C.

The standard cycles were as follows:

	Denaturation: 94°C, 2 min
5 cycles:	Denaturation: 94°C, 30 seconds
	Hybridization: 50°C, 50 seconds
	Elongation: 72°C, 1 min. or 2 min. and 40 sec.
25 cycles :	Denaturation: 94°C, 30 seconds
	Hybridization: 68°C, 50 seconds

Elongation: 72°C, 1 min. or 2 min. and 40 sec.

Elongation time was 1 minute for ORFs shorter than 2000bp and 2:40 minutes for ORFs longer than 2000bp. Amplifications were performed using a Gene Amp PCR system 9600 (Perkin Elmer).

To check amplification results, 2µl of each PCR product were loaded onto 1-1.5 agarose gel and the size of amplified fragments was compared with DNA molecular weight standards (DNA marker IX Roche, 1kb DNA ladder Biolabs).

Single band PCR products were purified by PEG precipitation: 300 µl of TE buffer and 200 µl of 30% PEG 8000/30 mM $MgCl_2$ were added to 100 µl PCR reaction. After vortexing, the DNA was centrifuged for 20 min at 10000g, washed with 1 vol. 70% ethanol and the pellet dissolved in 30 µl TE. PCR products smaller than 350 bp were purified using a PCR purification Kit (Qiagen) and eluted with 30 µl of the provided elution buffer.

In order to evaluate the yield, 2µl of the purified DNA were subjected to agarose gel electrophoresis and compared to titrated molecular weight standards.

D) Cloning of PCR products into expression vectors

Cloning was performed following the Gateway™ technology's "one-tube protocol", which consists of a two step reaction (BP and LR) for direct insertion of PCR products into expression vectors.

BP reaction (*att*B x *att*P sites): The reaction allowed insertion of the PCR product into a pDONR vector. The pDONR™ 201 vector we used contains the killer toxin gene *ccdB* between *att*P1 and *att*P2 sites to minimize background colonies lacking the PCR insert, and a selectable marker gene for kanamycin resitance. The reaction resulted in a so called pEntry vector, in which the GBS gene was located between *att*L1 and *att*L2 sites.

60 fmol of PCR product and 100 ng of pDONR™ 201 vector were incubated with 2.5 µl of BP clonase™ in a final volume of 12.5 µl for 4 hours at 25°C.

LR reaction (*att*L x *att*R sites): The reaction allowed the insertion of the GBS gene, now present in the pEntry vector, into *E.coli* expression vectors (pDestination vectors, containing *att*R sites). Two pDestination vectors were used (pDEST15 for N- terminal GST fusions – Figure 86; and pDEST17-1 for N-terminal His-tagged fusions – Figure 87). Both allow transcription of the ORF fusion coding mRNA under T7 RNA polymerase promoter [Studier *et al* (1990) *Meth. Enzymol* 185: 60*ff*].

To 5 µl of BP reaction were added 0.25 µl of 0.75 M NaCl, 100 ng of destination vector and 1.5 µl of LR clonase™ . The reaction was incubated at 25°C for 2 hours and stopped with 1 µl of 1 mg/ml proteinase K solution at 37°C for 15 min.

1 µl of the completed reaction was used to transform 50 µl electrocompetent BL21-SI™ cells (0.1 cm, 200 ohms, 25 µF). BL21-SI cells contain an integrated T7 RNA polymerase gene under the control of the salt-inducible *prU* promoter [Gowrishankar (1985) *J. Bacteriol.* 164:434*ff*]. After electroporation cells were diluted in 1ml SOC medium (20 g/l bacto-tryptone, 5 g/l yeast extract, 0.58 g/l NaCl, 0.186 g/l KCl, 20 mM glucose, 10 mM $MgCl_2$) and incubated at 37°C for 1 hour. 200 µl cells were plated onto LBON plates (Luria Broth medium without NaCl) containing 100 µg/ ml ampicillin. Plates were then incubated for 16 hours at 37°C.

Entry clones: In order to allow the future preparation of Gateway compatible pEntry plasmids containing genes which might turn out of interest after immunological assays, 2.5 µl of BP reaction were incubated for 15 min in the presence of 3 µl 0.15 mg/ml proteinase K solution and then kept at –20°C. The reaction was in this way available to transform *E.coli* competent cells so as to produce Entry clones for future introduction of the genes in other Destination vectors.

E) Protein expression

Single colonies derived from the transformation of LR reactions were inoculated as small-scale cultures in 3 ml LBON 100 µg/ml ampicillin for overnight growth at 25°C. 50-200 µl of the culture was inoculated in 3 ml LBON/Amp to an initial OD600 of 0.1. The cultures were grown at 37°C until OD600 0.4-0.6 and recombinant protein expression was induced by adding NaCl to a final concentration of 0.3 M. After 2 hour incubation the final OD was checked and the cultures were cooled on ice. 0.5 OD_{600} of cells were harvested by centrifugation. The cell pellet was suspended in 50 µl of protein Loading Sample Buffer (50 mM TRIS-HCl pH 6.8, 0.5% w/v SDS, 2.5% v/v glycerin, 0.05% w/v Bromophenol Blue, 100 mM DTT) and incubated at 100 °C for 5 min. 10 µl of sample was analyzed by SDS-PAGE and Coomassie Blue staining to verify the presence of induced protein band.

F) Purification of the recombinant proteins

Single colonies were inoculated in 25 ml LBON 100 µg/ml ampicillin and grown at 25°C overnight. The overnight culture was inoculated in 500 ml LBON/amp and grown under shaking at 25 °C until OD_{600} values of 0.4-0.6. Protein expression was then induced by adding NaCl to a final concentration of 0.3 M. After 3 hours incubation at 25 °C the final OD_{600} was checked and the cultures were cooled on ice. After centrifugation at 6000 rpm (JA10 rotor, Beckman) for 20 min., the cell pellet was processed for purification or frozen at –20 °C.

Proteins were purified in 1 of 3 ways depending on the fusion partner and the protein's solubility:

Purification of soluble His-tagged proteins from *E.coli*

1. Transfer pellets from –20°C to ice bath and reconstitute each pellet with 10 ml B-PER™ solution (Bacterial-Protein Extraction Reagent, Pierce cat. 78266), 10 µl of a 100 mM $MgCl_2$ solution, 50

µl of DNAse I (Sigma D-4263, 100 Kunits in PBS) and 100 µl of 100 mg/ml lysozyme in PBS (Sigma L-7651, final concentration 1 mg/ml).

2. Transfer resuspended pellets in 50 ml centrifuge tubes and leave at room temperature for 30-40 minutes, vortexing 3-4 times.
3. Centrifuge 15-20 minutes at about 30-40000 x *g*.
4. Prepare Poly-Prep (Bio-Rad) columns containing 1 ml of Fast Flow Ni-activated Chelating Sepharose (Pharmacia). Equilibrate with 50 mM phosphate buffer, 300 mM NaCl, pH 8.0.
5. Store the pellet at –20°C, and load the supernatant on to the columns.
6. Discard the flow through.
7. Wash with 10 ml 20 mM imidazole buffer, 50 mM phosphate, 300 mM NaCl, pH 8.0.
8. Elute the proteins bound to the columns with 4.5 ml (1.5 ml + 1.5 ml + 1.5 ml) 250 mM imidazole buffer, 50 mM phosphate, 300 mM NaCl, pH 8.0 and collect three fractions of ~1.5 ml each. Add to each tube 15 µl DTT 200 mM (final concentration 2 mM).
9. Measure the protein concentration of the collected fractions with the Bradford method and analyse the proteins by SDS-PAGE.
10. Store the collected fractions at +4°C while waiting for the results of the SDS-PAGE analysis.
11. For immunisation prepare 4-5 aliquots of 20-100 µg each in 0.5 ml in 40% glycerol. The dilution buffer is the above elution buffer, plus 2 mM DTT. Store the aliquots at –20°C until immunisation.

Purification of His-tagged proteins from inclusion bodies

1. Bacteria are collected from 500 ml cultures by centrifugation. If required store bacterial pellets at -20°C. Transfer the pellets from -20°C to room temperature and reconstitute each pellet with 10 ml B-PER™ solution, 10 µl of a 100 mM $MgCl_2$ solution (final 1 mM), 50 µl of DNAse I equivalent to 100 Kunits units in PBS and 100 µl of a 100 mg/ml lysozime (Sigma L-7651) solution in PBS (equivalent to 10 mg, final concentration 1 mg/ml).
2. Transfer the resuspended pellets in 50 ml centrifuge tubes and let at room temperature for 30-40 minutes, vortexing 3-4 times.
3. Centrifuge 15 minutes at 30-4000 x g and collect the pellets.
4. Dissolve the pellets with 50 mM TRIS-HCl, 1 mM TCEP {Tris(2-carboxyethyl)-phosphine hydrochloride, Pierce} , 6M guanidine hydrochloride, pH 8.5. Stir for ~ 10 min. with a magnetic bar.
5. Centrifuge as described above, and collect the supernatant.
6. Prepare Poly-Prep (Bio-Rad) columns containing 1 ml of Fast Flow Ni-activated Chelating Sepharose (Pharmacia). Wash the columns twice with 5 ml of H_2O and equilibrate with 50 mM TRIS-HCl, 1 mM TCEP, 6M guanidine hydrochloride, pH 8.5.

7. Load the supernatants from step 5 onto the columns, and wash with 5 ml of 50 mM TRIS-HCl buffer, 1 mM TCEP, 6M urea, pH 8.5
8. Wash the columns with 10 ml of 20 mM imidazole, 50 mM TRIS-HCl , 6M urea, 1 mM TCEP, pH 8.5. Collect and set aside the first 5 ml for possible further controls.
9. Elute proteins bound to columns with 4.5ml buffer containing 250 mM imidazole, 50 mM TRIS-HCl, 6M urea, 1 mM TCEP, pH 8.5. Add the elution buffer in three 1.5 ml aliquots, and collect the corresponding three fractions. Add to each fraction 15 µl DTT (final concentration 2 mM).
10. Measure eluted protein concentration with Bradford method and analyse proteins by SDS-PAGE.
11. Dialyse overnight the selected fraction against 50 mM Na phosphate buffer, pH 8.8, containing 10% glycerol, 0.5 M arginine, 5 mM reduced glutathione, 0.5 mM oxidized glutathione, 2 M urea.
12. Dialyse against 50 mM Na phosphate buffer, pH 8.8, containing 10% glycerol, 0.5 M arginine, 5 mM reduced glutathione, 0.5 mM oxidized glutathione.
13. Clarify the dialysed protein preparation by centrifugation and discard the non-soluble material and measure the protein concentration with the Bradford method.
14. For each protein destined to the immunization prepare 4-5 aliquot of 20-100 µg each in 0.5 ml after having adjusted the glycerol content up to 40%. Store the prepared aliquots at –20° C until immunization.

Purification of GST-fusion proteins from *E.coli*

1. Bacteria are collected from 500 ml cultures by centrifugation. If required store bacterial pellets at -20°C. Transfer the pellets from –20°C to room temperature and reconstitute each pellet with 10 ml B-PER™ solution, 10 µl of a 100 mM $MgCl_2$ solution (final 1 mM), 50 µl of DNAse I equivalent to 100 Kunits units in PBS and 100 µl of a 100 mg/ml lysozime (Sigma L-7651) solution in PBS (equivalent to 10 mg, final concentration 1 mg/ml).
2. Transfer the resuspended pellets in 50 ml centrifuge tubes and let at room temperature for 30-40 minutes, vortexing 3-4 times.
3. Centrifuge 15-20 minutes at about 30-40000 x *g*.
4. Discard centrifugation pellets and load supernatants onto the chromatography columns, as follows.
5. Prepare Poly-Prep (Bio-Rad) columns containing 0.5 ml of Glutathione-Sepharose 4B resin. Wash the columns twice with 1 ml of H_20 and equilibrate with 10 ml PBS, pH 7.4.
6. Load supernatants on to the columns and discard the flow through.
7. Wash the columns with 10 ml PBS, pH 7.4.
8. Elute proteins bound to columns with 4.5 ml of 50 mM TRIS buffer, 10 mM reduced glutathione, pH 8.0, adding 1.5 ml + 1.5 ml + 1.5 ml and collecting the respective 3 fractions of ~1.5 ml each.

9. Measure protein concentration of the fractions with the Bradford method and analyse the proteins by SDS-PAGE.

10. Store the collected fractions at +4°C while waiting for the results of the SDS-PAGE analysis.

11. For each protein destined for immunisation prepare 4-5 aliquots of 20-100 µg each in 0.5 ml of 40% glycerol. The dilution buffer is 50 mM TRIS-HCl, 2 mM DTT, pH 8.0. Store the aliquots at –20°C until immunisation.

Figures 167 to 170 and 238 to 239

For the experiments shown in Figures 167 to 170, Figure 238 and lanes 2-6 of Figure 239, the GBS proteins were fused at the N-terminus to thioredoxin and at C-terminus to a poly-His tail. The plasmid used for cloning is pBAD-DEST49 (Invitrogen Gateway™ technology) and expression is under the control of an L(+)-Arabinose dependent promoter. For the production of these GBS antigens, bacteria are grown on RM medium (6g/l Na_2HPO_4, 3g/l KH_2PO_4, 0.5 g/l NaCl, 1 g/l NH_4Cl, pH7,4, 2% casaminoacids, 0.2 % glucose, 1 mM $MgCl_2$) containing 100 µg/ml ampicillin. After incubation at 37°C until cells reach OD_{600}=0.5, protein expression is induced by adding 0.2% (v/v) L(+)Arabinose for 3 hours.

Immunisations with GBS proteins

The purified proteins were used to immunise groups of four CD-1 mice intraperitoneally. 20 µg of each purified protein was injected in Freund's adjuvant at days 1, 21 & 35. Immune responses were monitored by using samples taken on day 0 & 49. Sera were analysed as pools of sera from each group of mice.

FACScan bacteria Binding Assay procedure.

GBS serotype V 2603 V/R strain was plated on TSA blood agar plates and incubated overnight at 37°C. Bacterial colonies were collected from the plates using a sterile dracon swab and inoculated into 100ml Todd Hewitt Broth. Bacterial growth was monitored every 30 minutes by following OD_{600}. Bacteria were grown until OD_{600} = 0.7-0.8. The culture was centrifuged for 20 minutes at 5000rpm. The supernatant was discarded and bacteria were washed once with PBS, resuspended in ½ culture volume of PBS containing 0.05% paraformaldehyde, and incubated for 1 hour at 37°C and then overnight at 4°C.

50µl bacterial cells (OD_{600} 0.1) were washed once with PBS and resuspended in 20µl blocking serum (Newborn Calf Serum, Sigma) and incubated for 20 minutes at room temperature. The cells were then incubated with 100µl diluted sera (1:200) in dilution buffer (20% Newborn Calf Serum 0.1% BSA in PBS) for 1 hour at 4°C. Cells were centrifuged at 5000rpm, the supernatant aspirated and cells washed by adding 200µl washing buffer (0.1% BSA in PBS). 50µl R-Phicoerytrin conjugated $F(ab)_2$ goat anti-mouse, diluted 1:100 in dilution buffer, was added to each sample and incubated for 1 hour at 4°C. Cells were spun down by centrifugation at 5000rpm and washed by adding 200µl of washing buffer. The

supernatant was aspirated and cells resuspended in 200µl PBS. Samples were transferred to FACScan tubes and read. The condition for FACScan setting were: FL2 on; FSC-H threshold:54; FSC PMT Voltage: E 02; SSC PMT: 516; Amp. Gains 2.63; FL-2 PMT: 728. Compensation values: 0.

Samples were considered as positive if they had a Δ mean values > 50 channel values.

Whole Extracts preparation

GBS serotype III COH1 strain and serotype V 2603 V/R strain cells were grown overnight in Todd Hewitt Broth. 1ml of the culture was inoculated into 100ml Todd Hewitt Broth. Bacterial growth was monitored every 30 minutes by following OD_{600}. The bacteria were grown until the OD reached 0.7-0.8. The culture was centrifuged for 20 minutes at 5000 rpm. The supernatant was discarded and bacteria were washed once with PBS, resuspended in 2ml 50mM Tris-HCl, pH 6.8 adding 400 units of Mutanolysin (Sigma-Aldrich) and incubated 3 hrs at 37°C. After 3 cycles of freeze/thaw, cellular debris were removed by centrifugation at 14000*g* for 15 minutes and the protein concentration of the supernatant was measured by the Bio-Rad Protein assay, using BSA as a standard.

Western blotting

Purified proteins (50ng) and total cell extracts (25µg) derived from GBS serotype III COH1 strain and serotype V 2603 V/R strain were loaded on 12% or 15% SDS-PAGE and transferred to a nitrocellulose membrane. The transfer was performed for 1 hours at 100V at 4°C, in transferring buffer (25mM Tris base, 192mM glycine, 20% methanol). The membrane was saturated by overnight incubation at 4°C in saturation buffer (5 % skimmed milk, 0.1% Tween 20 in PBS). The membrane was incubated for 1 hour at room temperature with 1:1000 mouse sera diluted in saturation buffer. The membrane was washed twice with washing buffer (3 % skimmed milk, 0.1% Tween 20 in PBS) and incubated for 1 hour with a 1:5000 dilution of horseradish peroxidase labelled anti-mouse Ig (Bio-Rad). The membrane was washed twice with 0.1% Tween 20 in PBS and developed with the Opti-4CN Substrate Kit (Bio-Rad). The reaction was stopped by adding water.

Unless otherwise indicated, lanes 1, 2 and 3 of blots in the drawings are: (1) the purified protein; (2) GBS-III extracts; and (3) GBS-V extracts. Molecular weight markers are also shown.

In vivo *passive protection assay in neonatal sepsis mouse model.*

The immune sera collected from the CD1 immunized mice were tested in a mouse neonatal sepsis model to verify their protective efficacy in mice challenged with GBS serotype III. Newborn Balb/C littermates were randomly divided in two groups within 24 hrs from birth and injected subcutaneously with 25µl of diluted sera (1:15) from immunized CD1 adult mice. One group received preimmune sera, the other received immune sera. Four hours later all pups were challenged with a 75% lethal dose of the GBS serotype III COH1 strain. The challenge dose obtained diluting a mid log phase culture was administered subcutaneously in 25 µl of saline. The number of pups surviving GBS infection was assessed every 12 hours for 4 days. Results are in Table III.

Example 1

A DNA sequence (GBSx1402) was identified in *S.agalactiae* <SEQ ID 1> which encodes the amino acid sequence <SEQ ID 2>. Analysis of this protein sequence reveals the following:

```
Possible site: 27
>>> Seems to have an uncleavable N-term signal seq
   INTEGRAL    Likelihood = -0.48   Transmembrane  169 - 185 ( 169 - 185)

----- Final Results -----
                bacterial membrane --- Certainty=0.1192(Affirmative) < succ>
                  bacterial outside --- Certainty=0.0000(Not Clear) < succ>
                bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database.

```
>GP:CAB88235 GB:AL353012 hypothetical serine-rich repeat protein

SEQ ID 2 (GBS4) was expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 9 (lane 3; MW 43.1kDa) and Figure 63 (lane 4; MW 50kDa). It was also expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 12 (lane 7; MW 30kDa), Figure 63 (lane 3; MW 30kDa) and in Figure 178 (lane 3; MW 30kDa).

GBS4-GST was purified as shown in Figure 190 (lane 6) and Figure 209 (lane 8).

Purified GBS4-His is shown in Figures 89A, 191 (lane 10), 209 (lane 7) and 228 (lanes 9 & 10).

The purified GBS4-His fusion product was used to immunise mice (lane 2 product; 20lg/mouse). The resulting antiserum was used for Western blot (Figure 89B), FACS, and in the *in vivo* passive protection assay (Table III). These tests confirm that the protein is immunoaccessible on GBS bacteria and that it is an effective protective immunogen.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 2

A DNA sequence (GBSx1100) was identified in *S.agalactiae* <SEQ ID 3> which encodes the amino acid sequence <SEQ ID 4>. This protein is predicted to be aggregation promoting protein. Analysis of this protein sequence reveals the following:

```
Possible site: 33
>>> Seems to have a cleavable N-term signal seq.

----- Final Results -----
                bacterial outside --- Certainty=0.3000(Affirmative) < succ>
               bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database.

```
>GP:CAA69725 GB:Y08498 aggregation promoting protein [Lactobacillus gasseri]
 Identities = 56/103 (54%), Positives = 69/103 (66%), Gaps = 5/103 (4%)

SEQ ID 8712 (GBS166) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 30 (lane 2; MW 13.1kDa).

The GBS166-His fusion product was purified (Figure 200, lane 10) and used to immunise mice. The resulting antiserum was used for FACS (Figure 315), which confirmed that the protein is immunoaccessible on GBS bacteria.

SEQ ID 4 (GBS15) was expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 9 (lane 5; MW 44.8kDa), Figure 63 (lane 5; MW 44.8kDa) and Figure 66 (lane 7; MW 45kDa). It was also expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 10 (lane 4; MW 22.3kDa). It was also expressed as GBS15L, with SDS-PAGE analysis of total cell extract is shown in Figure 185 (lane 1; MW 50kDa).

Purified GBS15-GST is shown in Figure 91A, Figure 190 (lane 9), Figure 210 (lane 4) and Figure 245 (lanes 4 & 5).

The purified GBS15-GST fusion product was used to immunise mice (lane 1 + 2 products; 20μg/mouse). The resulting antiserum was used for Western blot (Figure 91B), FACS (Figure 91C), and in the *in vivo* passive protection assay (Table III). These tests confirm that the protein is immunoaccessible on GBS bacteria and that it is an effective protective immunogen.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 3

A DNA sequence (GBSx0091) was identified in *S.agalactiae* <SEQ ID 303> which encodes the amino acid sequence <SEQ ID 304>. Analysis of this protein sequence reveals the following:

```
Possible site: 32

SEQ ID 6 (GBS103) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 36 (lane 4; MW 32kDa).

The GBS103-His fusion product was purified (Figure 107A; see also Figure 201, lane 9) and used to immunise mice (lane 2+3 product; 18.5µg/mouse). The resulting antiserum was used for Western blot (Figure 107B), FACS (Figure 107C) and in the *in vivo* passive protection assay (Table III). These tests confirm that the protein is immunoaccessible on GBS bacteria and that it is an effective protective immunogen.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 4

A DNA sequence (GBSx1316) was identified in *S.agalactiae* <SEQ ID 3837> which encodes the amino acid sequence <SEQ ID 3838>. Analysis of this protein sequence reveals the following:

```
Possible site: 23
>>> Seems to have no N-terminal signal sequence
   INTEGRAL    Likelihood = -4.30   Transmembrane 1058 -1074 (1056 -1075)

----- Final Results -----
                bacterial membrane --- Certainty=0.2720(Affirmative) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

A related GBS gene <SEQ ID 7> and protein <SEQ ID 8> were also identified. Analysis of this protein sequence reveals the following:

```
Lipop: Possible site: -1   Crend: 10
McG: Discrim Score:    -13.26
GvH: Signal Score (-7.5): -5.76
     Possible site: 41
>>> Seems to have no N-terminal signal sequence
ALOM program   count: 1 value:  -4.30 threshold:  0.0
   INTEGRAL    Likelihood = -4.30   Transmembrane  489 - 505 ( 487 - 506)
   PERIPHERAL  Likelihood =  3.71       97
 modified ALOM score:   1.36

*** Reasoning Step: 3

----- Final Results -----
                bacterial membrane --- Certainty=0.2720(Affirmative) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>

LPXTG motif: 478-482
```

SEQ ID 8 (GBS195) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 24 (lane 8). It was also expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 31 (lane 5).

GBS195C was expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 175 (lane 6 & 7; MW 81kDa).

GBS195L was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 83 (lane 2; MW 123kDa).

GBS195LN was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 83 (lane 3; MW 66kDa).

GBS195-GST was purified as shown in Figure 198, lane 5. GBS195-His was purified as shown in Figure 222, lane 4-5. GBS195N-His was purified as shown in Figure 222, lane 6-7.

The GBS195-GST fusion product was purified (Figure 87A) and used to immunise mice (lane 1 product; 13.6μg/mouse). The resulting antiserum was used for Western blot (Figure 87B), FACS, and in the *in vivo* passive protection assay (Table III). These tests confirm that the protein is immunoaccessible on GBS bacteria and that it is an effective protective immunogen.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 5

A DNA sequence (GBSx0002) was identified in *S.agalactiae* <SEQ ID 4043> which encodes the amino acid sequence <SEQ ID 4044>. This protein is predicted to be lipoprotein MtsA. Analysis of this protein sequence reveals the following:

```
Possible site: 19

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.3361(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

A related GBS nucleic acid sequence <SEQ ID 9403> which encodes amino acid sequence <SEQ ID 9404> was also identified.

A related DNA sequence was identified in *S.pyogenes* <SEQ ID 3177> which encodes the amino acid sequence <SEQ ID 3178>. Analysis of this protein sequence reveals the following:

```
      Possible site: 13

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.2412(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

SEQ ID 22 (GBS272d) was expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 147 (lane 9; MW 55kDa + lane 10; MW 70kDa). It was also expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 147 (lane 11 & 13; MW 85kDa + lane 12; MW 74kDa).

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 12

A DNA sequence (GBSx0009) was identified in *S.agalactiae* <SEQ ID 25> which encodes the amino acid sequence <SEQ ID 26>. This protein is predicted to be para-aminobenzoate synthetase (pabB) (pabB). Analysis of this protein sequence reveals the following:

```
Possible site: 61

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.4073(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 20

A DNA sequence (GBSx0017) was identified in *S.agalactiae* <SEQ ID 53> which encodes the amino acid sequence <SEQ ID 54>. This protein is predicted to be ribosomal protein L1 (rplA). Analysis of this protein sequence reveals the following:

```
Possible site: 30

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.2285(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:CAB11879 GB:Z99104 ribosomal protein L1 (BLl) [Bacillus subtilis]
 Identities = 144/228 (63%), Positives = 177/228 (77%)

SEQ ID 8470 (GBS186) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 35 (lane 7; MW 60kDa). It was also expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 41 (lane 6; MW 85.7kDa).

GBS186-GST was purified as shown in Figure 202, lane 4.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 22

A DNA sequence (GBSx0019) was identified in *S.agalactiae* <SEQ ID 61> which encodes the amino acid sequence <SEQ ID 62>. Analysis of this protein sequence reveals the following:

```
Possible site: 37

>>> Seems to have a cleavable N-term signal seq.
   INTEGRAL    Likelihood = -5.95   Transmembrane  101 - 117 (  99 - 123)
   INTEGRAL    Likelihood = -4.73   Transmembrane  276 - 292 ( 275 - 293)

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 27

A DNA sequence (GBSx0024) was identified in *S.agalactiae* <SEQ ID 81> which encodes the amino acid sequence <SEQ ID 82>. Analysis of this protein sequence reveals the following:

```
Possible site: 22

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
              bacterial cytoplasm --- Certainty=0.3712(Affirmative) < succ>
               bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 28

A DNA sequence (GBSx0025) was identified in *S.agalactiae* <SEQ ID 83> which encodes the amino acid sequence <SEQ ID 84>. This protein is predicted to be ribosome recycling factor (frr). Analysis of this protein sequence reveals the following:

```
Possible site: 34

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
              bacterial cytoplasm --- Certainty=0.3522(Affirmative) < succ>

```

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 30

A DNA sequence (GBSx0028) was identified in *S.agalactiae* <SEQ ID 91> which encodes the amino acid sequence <SEQ ID 92>. This protein is predicted to be peptide methionine sulfoxide reductase (msrA). Analysis of this protein sequence reveals the following:

```
Possible site: 33

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
              bacterial cytoplasm --- Certainty=0.0866(Affirmative) < succ>
               bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

A related GBS nucleic acid sequence <SEQ ID 10021> which encodes amino acid sequence <SEQ ID 10022> was also identified.

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:BAB05167 GB:AP001512 peptide methionine sulfoxide reductase

ALOM program   count: 1 value:  -4.57 threshold:  0.0
   INTEGRAL    Likelihood = -4.57   Transmembrane   26 -  42 (  26 -  45)
   PERIPHERAL  Likelihood =  6.79      378
 modified ALOM score:   1.41

*** Reasoning Step: 3

----- Final Results -----
                bacterial membrane --- Certainty=0.2826(Affirmative) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear)
```

SEQ ID 8476 (GBS90) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 18 (lane 6; MW 68.5kDa).

The GBS90-His fusion product was purified (Figure 194, lane 11) and used to immunise mice. The resulting antiserum was used for Western blot (Figure 256A), FACS (Figure 256B), and in the *in vivo* passive protection assay (Table III). These tests confirm that the protein is immunoaccessible on GBS bacteria and that it is an effective protective immunogen.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 33

A DNA sequence (GBSx0031) was identified in *S.agalactiae* <SEQ ID 103> which encodes the amino acid sequence <SEQ ID 104>. This protein is predicted to be phoh-like protein (phoH). Analysis of this protein sequence reveals the following:

```
Possible site: 38

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.2339(Affirmative) < succ>

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 34

A DNA sequence (GBSx0032) was identified in *S.agalactiae* <SEQ ID 107> which encodes the amino acid sequence <SEQ ID 108>. Analysis of this protein sequence reveals the following:

```
Possible site: 30

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.0275(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 35

A DNA sequence (GBSx0033) was identified in *S.agalactiae* <SEQ ID 109> which encodes the amino acid sequence <SEQ ID 110>. This protein is predicted to be MutT/nudix family protein. Analysis of this protein sequence reveals the following:

```
Possible site: 46

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.2383(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:AAF09597 GB:AE001864 MutT/nudix family protein [Deinococcus radiodurans]

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 36

A DNA sequence (GBSx0034) was identified in *S.agalactiae* <SEQ ID 113> which encodes the amino acid sequence <SEQ ID 114>. Analysis of this protein sequence reveals the following:

```
Possible site: 13

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.3690(Affirmative) < succ>
               bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
               bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 37

A DNA sequence (GBSx0035) was identified in *S.agalactiae* <SEQ ID 115> which encodes the amino acid sequence <SEQ ID 116>. Analysis of this protein sequence reveals the following:

```
Possible site: 25

>>> Seems to have a cleavable N-term signal seq.

----- Final Results -----
               bacterial outside --- Certainty=0.3000(Affirmative) < succ>

SEQ ID 8478 (GBS176) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 36 (lane 5 & 6; MW 30kDa). It was also expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 41 (lane 7; MW 55.4kDa).

The GBS176-GST fusion product was purified (Figure 117A; see also Figure 202, lane 5) and used to immunise mice (lane 1+2 product; 13.5µg/mouse). The resulting antiserum was used for Western blot (Figure 117B), FACS (Figure 117C), and in the *in vivo* passive protection assay (Table III). These tests confirm that the protein is immunoaccessible on GBS bacteria and that it is an effective protective immunogen.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 38

A DNA sequence (GBSx0036) was identified in *S.agalactiae* <SEQ ID 117> which encodes the amino acid sequence <SEQ ID 118>. Analysis of this protein sequence reveals the following:

```
Possible site: 32

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.3712(Affirmative) < succ>

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 41

A DNA sequence (GBSx0040) was identified in *S.agalactiae* <SEQ ID 129> which encodes the amino acid sequence <SEQ ID 130>. Analysis of this protein sequence reveals the following:

```
Possible site: 40

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
                bacterial cytoplasm --- Certainty=0.1011(Affirmative) < succ>

```

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 43

A DNA sequence (GBSx0042) was identified in *S.agalactiae* <SEQ ID 137> which encodes the amino acid sequence <SEQ ID 138>. Analysis of this protein sequence reveals the following:

```
Possible site: 15

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
                bacterial cytoplasm --- Certainty=0.1126(Affirmative) < succ>
                 bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                  bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 44

A DNA sequence (GBSx0043) was identified in *S.agalactiae* <SEQ ID 139> which encodes the amino acid sequence <SEQ ID 140>. Analysis of this protein sequence reveals the following:

```
Possible site: 25

>>> Seems to have an uncleavable N-term signal seq

SEQ ID 8480 (GBS39) was expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 12 (lane 9; MW 65.2kDa) and Figure 15 (lane 3; MW 40kDa).

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 45

A DNA sequence (GBSx0044) was identified in *S.agalactiae* <SEQ ID 143> which encodes the amino acid sequence <SEQ ID 144>. This protein is predicted to be UDP-sugar hydrolase. Analysis of this protein sequence reveals the following:

```
Possible site: 17

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
              bacterial cytoplasm --- Certainty=0.3908(Affirmative) < succ>
               bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:CAB15227 GB:Z99120 similar to hypothetical proteins [Bacillus subtilis]
 Identities = 114/280 (40%), Positives = 173/280 (61%), Gaps = 9/280 (3%)

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 54

A DNA sequence (GBSx0053) was identified in *S.agalactiae* <SEQ ID 171> which encodes the amino acid sequence <SEQ ID 172>. Analysis of this protein sequence reveals the following:

```
Possible site: 17

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.3914(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 55

A DNA sequence (GBSx0054) was identified in *S.agalactiae* <SEQ ID 173> which encodes the amino acid sequence <SEQ ID 174>. Analysis of this protein sequence reveals the following:

```
Possible site: 15

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.1864(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

A related GBS nucleic acid sequence <SEQ ID 9611> which encodes amino acid sequence <SEQ ID 9612> was also identified.

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:BAB05467 GB:AP001513 biotin synthase [Bacillus halodurans]

```

A related GBS nucleic acid sequence <SEQ ID 9613> which encodes amino acid sequence <SEQ ID 9614> was also identified.

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 57

A DNA sequence (GBSx0056) was identified in *S.agalactiae* <SEQ ID 177> which encodes the amino acid sequence <SEQ ID 178>. Analysis of this protein sequence reveals the following:

```
Possible site: 15

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
              bacterial cytoplasm --- Certainty=0.1985(Affirmative) < succ>
               bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 58

A DNA sequence (GBSx0057) was identified in *S.agalactiae* <SEQ ID 179> which encodes the amino acid sequence <SEQ ID 180>. Analysis of this protein sequence reveals the following:

```
Possible site: 32

>>> Seems to have no N-terminal signal sequence
   INTEGRAL    Likelihood = -0.11   Transmembrane  347 - 363 ( 347 - 363)

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 60

A DNA sequence (GBSx0059) was identified in *S.agalactiae* <SEQ ID 187> which encodes the amino acid sequence <SEQ ID 188>. This protein is predicted to be endonuclease III (pdg). Analysis of this protein sequence reveals the following:

```
Possible site: 46

>>> Seems to have no N-terminal signal sequence
   INTEGRAL    Likelihood = -0.00   Transmembrane   25 -  41 (  25 -  41)

----- Final Results -----
               bacterial membrane --- Certainty=0.1001(Affirmative) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>
              bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```

SEQ ID 8484 (GBS13) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 3 (lane 4; MW 16kDa). It was also expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 9 (lane 2; MW 40.5kDa).

The GST-fusion protein was purified as shown in Figure 190, lane 5.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 64

A DNA sequence (GBSx0063) was identified in *S.agalactiae* <SEQ ID 203> which encodes the amino acid sequence <SEQ ID 204>. This protein is predicted to be regulatory protein TypA (typA). Analysis of this protein sequence reveals the following:

```
Possible site: 36

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
        bacterial cytoplasm --- Certainty=0.1738(Affirmative) < succ>
```

```
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:CAB13350 GB:Z99111 similar to GTP-binding elongation factor
          [Bacillus subtilis]
 Identities = 455/609 (74%), Positives = 534/609 (86%), Gaps = 2/609 (0%)

SEQ ID 208 (GBS305) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 51 (lane 11; MW 53.7kDa). It was also expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 56 (lane 3; MW 79kDa).

The GBS305-GST fusion product was purified (Figure 207, lane 8) and used to immunise mice. The resulting antiserum was used for FACS (Figure 270), which confirmed that the protein is immunoaccessible on GBS bacteria.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 66

A DNA sequence (GBSx0066) was identified in *S.agalactiae* <SEQ ID 211> which encodes the amino acid sequence <SEQ ID 212>. Analysis of this protein sequence reveals the following:

```
RGD motif 285-287

Possible site: 60

>>> Seems to have no N-terminal signal sequence

SEQ ID 212 (GBS306) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 51 (lane 12; MW 43kDa). It was also expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 56 (lane 4; MW 68kDa).

GBS306-GST was purified as shown in Figure 207, lane 9.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 67

A DNA sequence (GBSx0067) was identified in *S.agalactiae* <SEQ ID 215> which encodes the amino acid sequence <SEQ ID 216>. This protein is predicted to be cell division protein DivIB. Analysis of this protein sequence reveals the following:

```
Possible site: 58
```

```
>>> Seems to have no N-terminal signal sequence
   INTEGRAL     Likelihood =-14.33   Transmembrane  103 - 119 (  96 - 124)

----- Final Results -----
                bacterial membrane --- Certainty=0.6731(Affirmative) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:AAC95451 GB:AF068902 cell division protein DivIB [Streptococcus pneumoniae]
 Identities = 119/396 (30%), Positives = 214/396 (53%), Gaps = 38/396 (9%)

SEQ ID 216 (GBS85) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 17 (lane 10; MW 45.2kDa).

The GBS85-His fusion product was purified (Figure 105A; see also Figure 193, lane 5) and used to immunise mice (lane 1 product; 20μg/mouse). The resulting antiserum was used for Western blot (Figure 105B), FACS (Figure 105C), and in the *in vivo* passive protection assay (Table III). These tests confirm that the protein is immunoaccessible on GBS bacteria and that it is an effective protective immunogen.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 68

A DNA sequence (GBSx0068) was identified in *S.agalactiae* <SEQ ID 219> which encodes the amino acid sequence <SEQ ID 220>. This protein is predicted to be cell division protein FtsA (ftsA). Analysis of this protein sequence reveals the following:

```
Possible site: 56

>>> Seems to have an uncleavable N-term signal seq
    INTEGRAL    Likelihood = -3.19   Transmembrane  322 - 338 ( 321 - 338)

----- Final Results -----
                bacterial membrane --- Certainty=0.2275(Affirmative) < succ>

SEQ ID 220 (GBS73) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 17 (lane 5; MW 47.8kDa). It was also expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 20 (lane 5; MW 70.1kDa).

GBS73-GST was purified as shown in Figure 197, lane 7.

The GBS73-His fusion product was purified (Figure 103A) and used to immunise mice (lane 1 product; 20μg/mouse). The resulting antiserum was used for Western blot (Figure 103B), FACS (Figure 103C) and in the *in vivo* passive protection assay (Table III). These tests confirm that the protein is immunoaccessible on GBS bacteria and that it is an effective protective immunogen.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 69

A DNA sequence (GBSx0069) was identified in *S.agalactiae* <SEQ ID 223> which encodes the amino acid sequence <SEQ ID 224>. This protein is predicted to be cell division protein FtsZ (ftsz). Analysis of this protein sequence reveals the following:

```
Possible site: 56
```

```
>>> Seems to have a cleavable N-term signal seq.
   INTEGRAL    Likelihood = -1.97   Transmembrane  117 - 133 ( 117 - 133)

SEQ ID 224 (GBS163) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 28 (lane 7; MW 44kDa). It was also expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 34 (lane 4; MW 69kDa).

The GBS163-GST fusion product was purified (Figure 114A; see also Figure 198, lane 11) and used to immunise mice (lane 1 product; 20μg/mouse). The resulting antiserum was used for Western blot (Figure 114B), FACS and in the *in vivo* passive protection assay (Table III). These tests confirm that the protein is immunoaccessible on GBS bacteria and that it is an effective protective immunogen.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 70

A DNA sequence (GBSx0070) was identified in *S.agalactiae* <SEQ ID 227> which encodes the amino acid sequence <SEQ ID 228>. Analysis of this protein sequence reveals the following:

```
Possible site: 21

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.2750(Affirmative) < succ>

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 75

A DNA sequence (GBSx0075) was identified in *S.agalactiae* <SEQ ID 247> which encodes the amino acid sequence <SEQ ID 248>. Analysis of this protein sequence reveals the following:

```
Possible site: 39

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.3425(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

A related DNA sequence was identified in *S.pyogenes* <SEQ ID 249> which encodes the amino acid sequence <SEQ ID 250>. Analysis of this protein sequence reveals the following:

```
Possible site: 32

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.3467(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

An alignment of the GAS and GBS proteins is shown below:

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 78

A DNA sequence (GBSx0078) was identified in *S.agalactiae* <SEQ ID 259> which encodes the amino acid sequence <SEQ ID 260>. This protein is predicted to be glutamine ABC transporter, permease protein (glnP). Analysis of this protein sequence reveals the following:

```
Possible site: 61

>>> Seems to have an uncleavable N-term signal seq
   INTEGRAL     Likelihood = -9.92   Transmembrane   27 -  43 ( 15 -  46)
   INTEGRAL     Likelihood = -2.50   Transmembrane  200 - 216 ( 196 - 217)

----- Final Results -----
               bacterial membrane --- Certainty=0.4970(Affirmative) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>
              bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

A related GBS nucleic acid sequence <SEQ ID 9619> which encodes amino acid sequence <SEQ ID 9620> was also identified.

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:AAB91000 GB:AE001090 glutamine ABC transporter, permease protein
          (glnP) [Archaeoglobus fulgidus]

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 80

A DNA sequence (GBSx0080) was identified in *S.agalactiae* <SEQ ID 267> which encodes the amino acid sequence <SEQ ID 268>. This protein is predicted to be methylenetetrahydrofolate dehydrogenase (folD). Analysis of this protein sequence reveals the following:

```
Possible site: 48

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.4672(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:AAC44612 GB:U58210 tetrahydrofolate dehydrogenase/cyclohydrolase
            [Streptococcus thermophilus]
 Identities = 209/282 (74%), Positives = 248/282 (87%)
```

No corresponding DNA sequence was identified in *S.pyogenes*.

SEQ ID 272 (GBS413) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 79 (lane 2; MW 34.2kDa). It was also expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 171 (lane 7; MW 59kDa).

GBS413-GST was purified as shown in Figure 218, lane 12.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 82

A DNA sequence (GBSx0082) was identified in *S.agalactiae* <SEQ ID 273> which encodes the amino acid sequence <SEQ ID 274>. This protein is predicted to be Exonuclease VII large subunit (xseA). Analysis of this protein sequence reveals the following:

```
Possible site: 36

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
                bacterial cytoplasm --- Certainty=0.3172(Affirmative) < succ>

SEQ ID 286 (GBS310) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 57 (lane 3; MW 34kDa). It was also expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 61 (lane 4; MW 58.8kDa).

The GBS310-GST fusion product was purified (Figure 210, lane 10) and used to immunise mice. The resulting antiserum was used for FACS (Figure 282), which confirmed that the protein is immunoaccessible on GBS bacteria.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 86

A DNA sequence (GBSx0086) was identified in *S.agalactiae* <SEQ ID 289> which encodes the amino acid sequence <SEQ ID 290>. Analysis of this protein sequence reveals the following:

```
Possible site: 18

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.1966(Affirmative) < succ>

Sbjct: 131 AIPSLIADDDSLLLIAKSPSEADMIRQSILLWMQ 164
```

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 87

A DNA sequence (GBSx0088) was identified in *S.agalactiae* <SEQ ID 293> which encodes the amino acid sequence <SEQ ID 294>. Analysis of this protein sequence reveals the following:

```
Possible site: 15

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
              bacterial cytoplasm --- Certainty=0.3339(Affirmative) < succ>
               bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 88

A DNA sequence (GBSx0089) was identified in *S.agalactiae* <SEQ ID 295> which encodes the amino acid sequence <SEQ ID 296>. This protein is predicted to be DNA repair protein recn (recN). Analysis of this protein sequence reveals the following:

```
Possible site: 50

>>> Seems to have no N-terminal signal sequence

----- Final Results -----

SEQ ID 9294 (GBS663) was expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 137 (lane 3; MW 89.5kDa). It was also expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 137 (lane 5-7; MW 64.5kDa), in Figure

179 (lane 11; MW 65kDa) and in Figure 65 (lane 2; MW 61kDa). Purified GBS663-His is shown in Figure 231, lane 3-4. Purified GBS324-His is shown in lane 6 of Figure 210.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 93

A DNA sequence (GBSx0095) was identified in *S.agalactiae* <SEQ ID 319> which encodes the amino acid sequence <SEQ ID 320>. This protein is predicted to be transmembrane protein OppB (oppB). Analysis of this protein sequence reveals the following:

```
Possible site: 37

>>> Seems to have no N-terminal signal sequence
   INTEGRAL     Likelihood =-10.77   Transmembrane  293 - 309 ( 281 - 313)
   INTEGRAL     Likelihood = -9.77   Transmembrane   21 -  37 (  14 -  46)
   INTEGRAL     Likelihood = -6.32   Transmembrane  115 - 131 ( 105 - 132)
   INTEGRAL     Likelihood = -4.88   Transmembrane  144 - 160 ( 140 - 166)
   INTEGRAL     Likelihood = -3.03   Transmembrane  238 - 254 ( 237 - 255)

----- Final Results -----
               bacterial membrane --- Certainty=0.5310(Affirmative) < succ>

```

There is also homology to SEQ ID 72.

SEQ ID 326 (GBS375) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 64 (lane 9; MW 42kDa). It was also expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 71 (lane 3; MW 67kDa).

GBS375-GST was purified as shown in Figure 215, lane 10.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 96

A DNA sequence (GBSx0098) was identified in *S.agalactiae* <SEQ ID 327> which encodes the amino acid sequence <SEQ ID 328>. Analysis of this protein sequence reveals the following:

```
Possible site: 28

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.3060(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:AAA62692 GB:M57689 sporulation protein [Bacillus subtilis]

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 97

A repeated DNA sequence (GBSx0099) was identified in *S.agalactiae* <SEQ ID 331> which encodes the amino acid sequence <SEQ ID 332>. Analysis of this protein sequence reveals the following:

```
Possible site: 28

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.3021(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 98

A repeated DNA sequence (GBSx0100) was identified in *S.agalactiae* <SEQ ID 333> which encodes the amino acid sequence <SEQ ID 334>. Analysis of this protein sequence reveals the following:

```
Possible site: 24

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.0352(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 99

A repeated DNA sequence (GBSx0101) was identified in *S.agalactiae* <SEQ ID 335> which encodes the amino acid sequence <SEQ ID 336>. Analysis of this protein sequence reveals the following:

```
Possible site: 23

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.5857(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 100

A repeated DNA sequence (GBSx0103) was identified in *S.agalactiae* <SEQ ID 337> which encodes the amino acid sequence <SEQ ID 338>. Analysis of this protein sequence reveals the following:

```
Possible site: 14

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.1472(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 101

A repeated DNA sequence (GBSx0104) was identified in *S.agalactiae* <SEQ ID 339> which encodes the amino acid sequence <SEQ ID 340>. Analysis of this protein sequence reveals the following:

```
Possible site: 13

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.0111(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 102

A repeated DNA sequence (GBSx0105) was identified in *S.agalactiae* <SEQ ID 341> which encodes the amino acid sequence <SEQ ID 342>. Analysis of this protein sequence reveals the following:

```
Possible site: 20

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.5628(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 103

A repeated DNA sequence (GBSx0106) was identified in *S.agalactiae* <SEQ ID 343> which encodes the amino acid sequence <SEQ ID 344>. Analysis of this protein sequence reveals the following:

```
Possible site: 39

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.2059(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 104

A repeated DNA sequence (GBSx0107) was identified in *S.agalactiae* <SEQ ID 345> which encodes the amino acid sequence <SEQ ID 346>. Analysis of this protein sequence reveals the following:

```
Possible site: 21

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.2045(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 105

A DNA sequence (GBSx0108) was identified in *S.agalactiae* <SEQ ID 347> which encodes the amino acid sequence <SEQ ID 348>. Analysis of this protein sequence reveals the following:

```
Possible site: 36

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
              bacterial cytoplasm --- Certainty=0.3031(Affirmative) < succ>
               bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 108

A DNA sequence (GBSx0111) was identified in *S.agalactiae* <SEQ ID 359> which encodes the amino acid sequence <SEQ ID 360>. Analysis of this protein sequence reveals the following:

```
Possible site: 36

>>> Seems to have no N-terminal signal sequence

----- Final Results -----
                bacterial cytoplasm --- Certainty=0.2299(Affirmative) < succ>
                 bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                  bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 109

A DNA sequence (GBSx0112) was identified in *S.agalactiae* <SEQ ID 361> which encodes the amino acid sequence <SEQ ID 362>. This protein is predicted to be AdcB protein (znuB). Analysis of this protein sequence reveals the following:

```
Possible site: 36

>>> Seems to have no N-terminal signal sequence

SEQ ID 374 (GBS64d) was expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 120 (lane 2-4; MW 107kDa). It was also expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 120 (lane 5-7; MW 82kDa) and in Figure 179 (lane 2; MW 82kDa).

GBS64d-His was purified as shown in Figure 231, lane 7-8.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 113

A DNA sequence (GBSx0116) was identified in *S.agalactiae* <SEQ ID 377> which encodes the amino acid sequence <SEQ ID 378>. This protein is predicted to be DNA-dependent RNA polymerase subunit beta (rpoB). Analysis of this protein sequence reveals the following:

```
Possible site: 61
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.3505(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 114

A DNA sequence (GBSx0118) was identified in *S.agalactiae* <SEQ ID 381> which encodes the amino acid sequence <SEQ ID 382>. This protein is predicted to be DNA-directed RNA polymerase, beta subunit (rpoC). Analysis of this protein sequence reveals the following:

```
Possible site: 32
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.1892(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

A related DNA sequence was identified in *S.pyogenes* <SEQ ID 383> which encodes the amino acid sequence <SEQ ID 384>. Analysis of this protein sequence reveals the following:

```
Possible site: 22
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.2128(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

An alignment of the GAS and GBS proteins is shown below:

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 116

A DNA sequence (GBSx0121) was identified in *S.agalactiae* <SEQ ID 389> which encodes the amino acid sequence <SEQ ID 390>. Analysis of this protein sequence reveals the following:

```
Possible site: 18
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.2433(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:AAC45310 GB:U81957 putative ABC transporter subunit ComYA

SEQ ID 390 (GBS63) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 5 (lane 5; MW 39kDa). It was also expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 13 (lane 2; MW 64kDa).

The GBS63-GST fusion product was purified (Figure 101A; see also Figure 191, lane 3) and used to immunise mice (lane 1 product; 20μg/mouse). The resulting antiserum was used for Western blot (Figure 101B), FACS (Figure 101C), and in the *in vivo* passive protection assay (Table III). These tests confirm that the protein is immunoaccessible on GBS bacteria and that it is an effective protective immunogen.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 117

A DNA sequence (GBSx0122) was identified in *S.agalactiae* <SEQ ID 393> which encodes the amino acid sequence <SEQ ID 394>. This protein is predicted to be competence protein (mshG). Analysis of this protein sequence reveals the following:

```
Possible site: 49
>>> Seems to have no N-terminal signal sequence
   INTEGRAL    Likelihood =-14.65   Transmembrane  123 - 139 ( 113 - 144)
   INTEGRAL    Likelihood =-13.53   Transmembrane  272 - 288 ( 264 - 295)
   INTEGRAL    Likelihood = -8.55   Transmembrane   79 -  95 (  75 - 102)
   INTEGRAL    Likelihood = -0.00   Transmembrane  146 - 162 ( 146 - 162)

----- Final Results -----
                bacterial membrane --- Certainty=0.6859(Affirmative) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

A related GBS nucleic acid sequence <SEQ ID 9489> which encodes amino acid sequence <SEQ ID 9490> was also identified.

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:AAC45311 GB:U81957 putative ABC transporter subunit ComYB

SEQ ID 8494 (GBS49) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 11 (lane 5; MW 15kDa). It was also was expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 15 (lane 5; MW 60kDa).

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 118

A DNA sequence (GBSx0123) was identified in *S.agalactiae* <SEQ ID 397> which encodes the amino acid sequence <SEQ ID 398>. This protein is predicted to be ComYD or ComGD. Analysis of this protein sequence reveals the following:

```
Possible site: 55
>>> Seems to have a cleavable N-term signal seq.

SEQ ID 398 (GBS6) was expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 1 (lane 2; MW 40kDa). It was also expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 2 (lane 2; MW 15kDa). The GBS6-GST fusion product was purified (Figure 189, lane 2) and used to immunise mice. The resulting antiserum was used for FACS (Figure 260), which confirmed that the protein is immunoaccessible on GBS bacteria.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 119

A DNA sequence (GBSx0124) was identified in *S.agalactiae* <SEQ ID 401> which encodes the amino acid sequence <SEQ ID 402>. Analysis of this protein sequence reveals the following:

```
Possible site: 43
>>> Seems to have no N-terminal signal sequence

----- Final Results -----

```

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 125

A DNA sequence (GBSx0130) was identified in *S.agalactiae* <SEQ ID 425> which encodes the amino acid sequence <SEQ ID 426>. Analysis of this protein sequence reveals the following:

```
Possible site: 26
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.1672(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 126

A DNA sequence (GBSx0131) was identified in *S.agalactiae* <SEQ ID 427> which encodes the amino acid sequence <SEQ ID 428>. Analysis of this protein sequence reveals the following:

```
Possible site: 31
>>> Seems to have no N-terminal signal sequence
   INTEGRAL    Likelihood = -2.28   Transmembrane   18 -  34 (  17 -  34)

----- Final Results -----
                bacterial membrane --- Certainty=0.1914(Affirmative) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

A related DNA sequence was identified in *S.pyogenes* <SEQ ID 429> which encodes the amino acid sequence <SEQ ID 430>. Analysis of this protein sequence reveals the following:

```
     Possible site: 21
>>> Seems to have an uncleavable N-term signal seq
   INTEGRAL    Likelihood = -6.16   Transmembrane   12 -  28 (   8 -  30)

----- Final Results -----
                bacterial membrane --- Certainty=0.3463(Affirmative) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

An alignment of the GAS and GBS proteins is shown below:

```

----- Final Results -----
                bacterial outside --- Certainty=0.3000(Affirmative) < succ>
               bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

SEQ ID 8498 (GBS214) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 40 (lane 3; MW 13.9kDa). It was also expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 46 (lane 6; MW 39kDa).

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 127

A DNA sequence (GBSx0132) was identified in *S.agalactiae* <SEQ ID 431> which encodes the amino acid sequence <SEQ ID 432>. This protein is predicted to be thioredoxin H1 (trxA). Analysis of this protein sequence reveals the following:

```
Possible site: 40
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
              bacterial cytoplasm --- Certainty=0.2350(Affirmative) < succ>
               bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 132

A DNA sequence (GBSx0138) was identified in *S.agalactiae* <SEQ ID 449> which encodes the amino acid sequence <SEQ ID 450>. Analysis of this protein sequence reveals the following:

```
Possible site: 20
>>> Seems to have no N-terminal signal sequence
   INTEGRAL     Likelihood = -0.22   Transmembrane    16 -  32 (  16 -  32)

----- Final Results -----
                bacterial membrane --- Certainty=0.1086(Affirmative) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 133

A DNA sequence (GBSx0139) was identified in *S.agalactiae* <SEQ ID 451> which encodes the amino acid sequence <SEQ ID 452>. Analysis of this protein sequence reveals the following:

```
Possible site: 34
>>> Seems to have an uncleavable N-term signal seq
   INTEGRAL     Likelihood = -5.04   Transmembrane    28 -  44 (  27 -  45)

----- Final Results -----
                bacterial membrane --- Certainty=0.3017(Affirmative) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 134

A DNA sequence (GBSx0140) was identified in *S.agalactiae* <SEQ ID 453> which encodes the amino acid sequence <SEQ ID 454>. Analysis of this protein sequence reveals the following:

```
Possible site: 17
>>> Seems to have an uncleavable N-term signal seq
   INTEGRAL    Likelihood =-10.72   Transmembrane   38 -  54 (  34 -  60)
   INTEGRAL    Likelihood = -7.70   Transmembrane    4 -  20 (   1 -  22)
   INTEGRAL    Likelihood = -4.99   Transmembrane  153 - 169 ( 150 - 171)
   INTEGRAL    Likelihood = -2.55   Transmembrane  179 - 195 ( 178 - 198)

SEQ ID 454 (GBS248d) was expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 124 (lane 2-4; MW 71kDa). It was also expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 124 (lane 5-7; MW 46kDa) and in Figure 180 (lane 2; MW 46kDa).

GBS248d-His was purified as shown in Figure 234, lane 3-4.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 135

A DNA sequence (GBSx0141) was identified in *S.agalactiae* <SEQ ID 457> which encodes the amino acid sequence <SEQ ID 458>. This protein is predicted to be two-component response regulator (lytT). Analysis of this protein sequence reveals the following:

```
Possible site: 61
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.3230(Affirmative) < succ>

```

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 136

A DNA sequence (GBSx0142) was identified in *S.agalactiae* <SEQ ID 461> which encodes the amino acid sequence <SEQ ID 462>. Analysis of this protein sequence reveals the following:

```
Possible site: 18
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
                bacterial cytoplasm --- Certainty=0.0266(Affirmative) < succ>
```

```
bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 137

A DNA sequence (GBSx0143) was identified in *S.agalactiae* <SEQ ID 463> which encodes the amino acid sequence <SEQ ID 464>. Analysis of this protein sequence reveals the following:

```
Possible site: 37
>>> Seems to have no N-terminal signal sequence
   INTEGRAL    Likelihood =-11.89   Transmembrane  104 - 120 (  99 - 134)

SEQ ID 8502 (GBS106) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 18 (lane 3; MW 61kDa).

The GBS106-His fusion product was purified (Figure 194, lane 2) and used to immunise mice. The resulting antiserum was used for Western blot (Figure 255A), FACS (Figure 255B), and in the *in vivo* passive protection assay (Table III). These tests confirm that the protein is immunoaccessible on GBS bacteria and that it is an effective protective immunogen.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 140

A DNA sequence (GBSx0146) was identified in *S.agalactiae* <SEQ ID 469> which encodes the amino acid sequence <SEQ ID 470>. Analysis of this protein sequence reveals the following:

```
Possible site: 41
>>> Seems to have no N-terminal signal sequence
```

```
----- Final Results -----
                bacterial cytoplasm --- Certainty=0.4862(Affirmative) < succ>
                 bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                  bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 141

A DNA sequence (GBSx0147) was identified in *S.agalactiae* <SEQ ID 471> which encodes the amino acid sequence <SEQ ID 472>. Analysis of this protein sequence reveals the following:

```
Possible site: 19
>>> Seems to have no N-terminal signal sequence
   INTEGRAL    Likelihood = -7.27   Transmembrane  252 - 268 ( 249 - 275)
   INTEGRAL    Likelihood = -5.73   Transmembrane   67 -  83 (  62 -  90)
   INTEGRAL    Likelihood = -5.26   Transmembrane  107 - 123 ( 104 - 134)
   INTEGRAL    Likelihood = -3.77   Transmembrane  153 - 169 ( 152 - 170)

----- Final Results -----
                bacterial membrane --- Certainty=0.3909(Affirmative) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

A related GBS nucleic acid sequence <SEQ ID 9295> which encodes amino acid sequence <SEQ ID 9296> was also identified.

The protein differs from U78968 at the N-terminus:

```
Query: 1   MASVNYDTSLTPVQYKAIAHHYGLDKPAPVQYPIWLKNPIQGHLGTSLVYRQPVIDIIRS 60
           MASVNYDTSLTP QYKAIAHHYGLDKPA VQYPIWLKN IQG LGTSLVYRQPV DIIRS
Sbjct: 39  MASVNYDTSLTPAQYKAIAHHYGLDKPALVQYPIWLKNVIQGDLGTSLVYRQPVSDIIRS 98
```

There is also homology to SEQ ID 64.

A related GBS gene <SEQ ID 8471> and protein <SEQ ID 8472> were also identified. Analysis of this protein sequence reveals the following:

```
Lipop: Possible site: -1   Cremd: 10
McG: Discrim Score:      3.72
GvH: Signal Score (-7.5): -5.37
     Possible site: 40
>>> Seems to have an uncleavable N-term signal seq
ALOM program   count: 5 value:  -7.27 threshold:  0.0
   INTEGRAL    Likelihood = -7.27   Transmembrane  290 - 306 ( 287 - 313)
   INTEGRAL    Likelihood = -5.89   Transmembrane   12 -  28 (  11 -  33)
   INTEGRAL    Likelihood = -5.73   Transmembrane  105 - 121 ( 100 - 128)
   INTEGRAL    Likelihood = -5.26   Transmembrane  145 - 161 ( 142 - 172)
   INTEGRAL    Likelihood = -3.77   Transmembrane  191 - 207 ( 190 - 208)
   PERIPHERAL  Likelihood =  2.97     245
 modified ALOM score:   1.95

*** Reasoning Step: 3

----- Final Results -----
                bacterial membrane --- Certainty=0.3909(Affirmative) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

SEQ ID 8472 (GBS436) was expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 173 (lane 9; MW 54kDa).

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 142

A DNA sequence (GBSx0148) was identified in *S.agalactiae* <SEQ ID 473> which encodes the amino acid sequence <SEQ ID 474>. This protein is predicted to be transmembrane transport protein DppC (oppC). Analysis of this protein sequence reveals the following:

```
Possible site: 39
>>> Seems to have a cleavable N-term signal seq.
   INTEGRAL    Likelihood = -8.28   Transmembrane    77 -  93 (  68 - 101)
   INTEGRAL    Likelihood = -7.80   Transmembrane   182 - 198 ( 180 - 204)
   INTEGRAL    Likelihood = -7.06   Transmembrane   112 - 128 ( 104 - 132)
   INTEGRAL    Likelihood = -5.10   Transmembrane   239 - 255 ( 235 - 258)

----- Final Results -----
               bacterial membrane --- Certainty=0.4312(Affirmative) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>
              bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

There is homology to SEQ ID 68.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 143

A DNA sequence (GBSx0149) was identified in *S.agalactiae* <SEQ ID 475> which encodes the amino acid sequence <SEQ ID 476>. This protein is predicted to be ATPase protein DppD. Analysis of this protein sequence reveals the following:

```
Possible site: 59
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.1957(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein differs from U78968 at the C-terminus:

```
Query: 241 QTSFARSLWRSLPQQEFLKGVTHDLRG 267
           QTSFAR LWR+LPQQ+FLKGVTHDLRG
Sbjct: 241 QTSFARRLWRTLPQQDFLKGVTHDLRG 267
```

A related DNA sequence was identified in *S.pyogenes* <SEQ ID 477> which encodes the amino acid sequence <SEQ ID 478>. Analysis of this protein sequence reveals the following:

```
Possible site: 59
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.1957(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

An alignment of the GAS and GBS proteins is shown below:

```

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 146

A DNA sequence (GBSx0152) was identified in *S.agalactiae* <SEQ ID 487> which encodes the amino acid sequence <SEQ ID 488>. This protein is predicted to be dextran glucosidase DexS (treC). Analysis of this protein sequence reveals the following:

```
Possible site: 48
```

```
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
                bacterial cytoplasm --- Certainty=0.3493(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:AAB65079 GB:U35633 dextran glucosidase DexS [Streptococcus suis]
 Identities = 383/547 (70%), Positives = 439/547 (80%), Gaps = 13/547 (2%)

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 147

A DNA sequence (GBSx0153) was identified in *S.agalactiae* <SEQ ID 491> which encodes the amino acid sequence <SEQ ID 492>. Analysis of this protein sequence reveals the following:

```
Possible site: 29
>>> Seems to have an uncleavable N-term signal seq
   INTEGRAL     Likelihood = -3.03   Transmembrane    8 -  24 (   8 -  25)

----- Final Results -----
               bacterial membrane --- Certainty=0.2211(Affirmative) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
              bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 148

A DNA sequence (GBSx0154) was identified in *S.agalactiae* <SEQ ID 493> which encodes the amino acid sequence <SEQ ID 494>. Analysis of this protein sequence reveals the following:

```
Possible site: 57
>>> Seems to have a cleavable N-term signal seq.

----- Final Results -----
                bacterial outside --- Certainty=0.3000(Affirmative) < succ>
               bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```

```
----- Final Results -----
               bacterial cytoplasm --- Certainty=0.3665(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

A related DNA sequence was identified in *S.pyogenes* <SEQ ID 499> which encodes the amino acid sequence <SEQ ID 500>. Analysis of this protein sequence reveals the following:

```
Possible site: 22
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.3665(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

An alignment of the GAS and GBS proteins is shown below:

```
 Identities = 33/35 (94%), Positives = 35/35 (99%)

Query: 1  MEKEAKQIIDLKRNLFKIDVRAQKDEEKVFMRTAW 35
          +EKEAKQ+IDLKRNLFKIDVRAQKDEEKVFMRTAW
Sbjct: 1  LEKEAKQMIDLKRNLFKIDVRAQKDEEKVFMRTAW 35
```

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 150

A repeated DNA sequence (GBSx0156) was identified in *S.agalactiae* <SEQ ID 501> which encodes the amino acid sequence <SEQ ID 502>. This protein is predicted to be a repeat-associated protein in rhsc-phrb intergenic region. Analysis of this protein sequence reveals the following:

```
Possible site: 44
>>> Seems to have no N-terminal signal sequence
   INTEGRAL    Likelihood = -4.57   Transmembrane   29 -  45 (  28 -  48)

----- Final Results -----
                bacterial membrane --- Certainty=0.2826(Affirmative) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

A closely-related DNA sequence was identified in *S.agalactiae* <SEQ ID 1035> which encodes the amino acid sequence <SEQ ID 1036>. Further related GBS sequences are: <SEQ ID 9067>, <SEQ ID 9068>, <SEQ ID 9497>, <SEQ ID 9498>, <SEQ ID 9733>, <SEQ ID 9734>

A related repeated DNA sequence was identified in *S.pyogenes* <SEQ ID 503> which encodes the amino acid sequence <SEQ ID 504>. Analysis of this protein sequence reveals the following:

```
Possible site: 44
>>> Seems to have no N-terminal signal sequence
   INTEGRAL    Likelihood = -4.57   Transmembrane   29 -  45 (  28 -  48)

----- Final Results -----
                bacterial membrane --- Certainty=0.2826(Affirmative) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

A related GBS gene <SEQ ID 8547> and protein <SEQ ID 8548> were also identified. Analysis of this protein sequence reveals the following:

```
Lipop Possible site: -1   Crend: 5
McG: Discrim Score:     -7.73
GvH: Signal Score (-7.5): -3.88
     Possible site: 44
>>> Seems to have no N-terminal signal sequence
ALOM program   count: 1 value:  -4.57 threshold:  0.0
   INTEGRAL    Likelihood = -4.57   Transmembrane   26 -  42 (  25 -  45)
   PERIPHERAL  Likelihood =  2.12     334
 modified ALOM score:   1.41

*** Reasoning Step: 3

----- Final Results -----
                bacterial membrane --- Certainty=0.2826(Affirmative) < succ>

A further related DNA sequence was identified in *S.pyogenes* <SEQ ID 9087> which encodes the amino acid sequence <SEQ ID 9088>. A further related DNA sequence was identified in *S.pyogenes* <SEQ ID 9089> which encodes the amino acid sequence <SEQ ID 9090>. The GAS and GBS proteins are 100% identical.

There is also homology to SEQ IDs 7018 and 8548.

SEQ ID 8548 (GBS318) was expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 46 (lane 5; MW 70kDa).

GBS318-GST was purified as shown in Figure 203, lane 3.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 151

A DNA sequence (GBSx0157) was identified in *S.agalactiae* <SEQ ID 505> which encodes the amino acid sequence <SEQ ID 506>. Analysis of this protein sequence reveals the following:

```
Possible site: 34
>>> Seems to have an uncleavable N-term signal seq

----- Final Results -----
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database, but there is homology to SEQ ID 496.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 152

A repeated DNA sequence (GBSx0158) was identified in *S.agalactiae* <SEQ ID 507> which encodes the amino acid sequence <SEQ ID 508>. Analysis of this protein sequence reveals the following:

```
Possible site: 48
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.1054(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:BAB03941 GB:AP001507 unknown conserved protein [Bacillus halodurans]

```

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 153

A DNA sequence (GBSx0159) was identified in *S.agalactiae* <SEQ ID 511> which encodes the amino acid sequence <SEQ ID 512>. Analysis of this protein sequence reveals the following:

```
Possible site: 20
>>> Seems to have an uncleavable N-term signal seq

----- Final Results -----
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 154

A DNA sequence (GBSx0160) was identified in *S.agalactiae* <SEQ ID 513> which encodes the amino acid sequence <SEQ ID 514>. This protein is predicted to be sgaT. Analysis of this protein sequence reveals the following:

```
Possible site: 16

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 155

A DNA sequence (GBSx0161) was identified in *S.agalactiae* <SEQ ID 517> which encodes the amino acid sequence <SEQ ID 518>. This protein is predicted to be transketolase, N-terminal subunit (tkt). Analysis of this protein sequence reveals the following:

```
Possible site: 45
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.3680 (Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000 (Not Clear) < succ>
```

```
bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:AAB98676 GB:U67515 transketolase' [Methanococcus jannaschii]
 Identities = 106/269 (39%), Positives = 158/269 (58%), Gaps = 4/269 (1%)

```

There is also homology to SEQ ID 520.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 157

A DNA sequence (GBSx0163) was identified in *S.agalactiae* <SEQ ID 523> which encodes the amino acid sequence <SEQ ID 524>. Analysis of this protein sequence reveals the following:

```
Possible site: 24
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
                bacterial cytoplasm --- Certainty=0.2517(Affirmative) < succ>
                 bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                  bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 158

A DNA sequence (GBSx0164) was identified in *S.agalactiae* <SEQ ID 525> which encodes the amino acid sequence <SEQ ID 526>. Analysis of this protein sequence reveals the following:

```
Possible site: 35
>>> Seems to have no N-terminal signal sequence
   INTEGRAL    Likelihood = -6.42   Transmembrane  119 - 135 ( 114 - 145)

```

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 161

A DNA sequence (GBSx0167) was identified in *S.agalactiae* <SEQ ID 535> which encodes the amino acid sequence <SEQ ID 536>. Analysis of this protein sequence reveals the following:

```
Possible site: 39
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.1293(Affirmative) < succ>
            bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
             bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

A related DNA sequence was identified in *S.pyogenes* <SEQ ID 537> which encodes the amino acid sequence <SEQ ID 538>. Analysis of this protein sequence reveals the following:

```
    Possible site: 38

>>> Seems to have no N-terminal signal sequence
   INTEGRAL    Likelihood = -0.43   Transmembrane   83 -  99 (  83 -  99)

----- Final Results -----
                bacterial membrane --- Certainty=0.1171(Affirmative) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

An alignment of the GAS and GBS proteins is shown below:

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 162

A DNA sequence (GBSx0168) was identified in *S.agalactiae* <SEQ ID 539> which encodes the amino acid sequence <SEQ ID 540>. This protein is predicted to be serine acetyltransferase (cysE). Analysis of this protein sequence reveals the following:

```
Possible site: 39
>>> Seems to have no N-terminal signal sequence
   INTEGRAL    Likelihood = -2.02   Transmembrane  150 - 166 ( 147 - 168)

----- Final Results -----

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 163

A DNA sequence (GBSx0169) was identified in *S.agalactiae* <SEQ ID 543> which encodes the amino acid sequence <SEQ ID 544>. Analysis of this protein sequence reveals the following:

```
Possible site: 29
>>> May be a lipoprotein
   INTEGRAL    Likelihood = -5.89   Transmembrane   32 -  48 (  29 -  49)

----- Final Results -----
                bacterial membrane --- Certainty=0.3357(Affirmative) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 164

A DNA sequence (GBSx0170) was identified in *S.agalactiae* <SEQ ID 545> which encodes the amino acid sequence <SEQ ID 546>. This protein is predicted to be cysteinyl-tRNA synthetase (cysS). Analysis of this protein sequence reveals the following:

```
Possible site: 46
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.2227(Affirmative) < succ>

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 165

A DNA sequence (GBSx0171) was identified in *S.agalactiae* <SEQ ID 549> which encodes the amino acid sequence <SEQ ID 550>. Analysis of this protein sequence reveals the following:

```
Possible site: 53
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.0259(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

A related GBS nucleic acid sequence <SEQ ID 9505> which encodes amino acid sequence <SEQ ID 9506> was also identified.

The protein has homology with the following sequences in the GENPEPT database:

```

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 169

A DNA sequence (GBSx0175) was identified in *S.agalactiae* <SEQ ID 565> which encodes the amino acid sequence <SEQ ID 566>. Analysis of this protein sequence reveals the following:

```
Possible site: 56
>>> Seems to have no N-terminal signal sequence
   INTEGRAL   Likelihood = -8.76   Transmembrane   43 -  59 (  40 -  62)
```

```
----- Final Results -----
                bacterial membrane --- Certainty=0.4503(Affirmative) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 170

A DNA sequence (GBSx0176) was identified in *S.agalactiae* <SEQ ID 567> which encodes the amino acid sequence <SEQ ID 568>. This protein is predicted to be ribosomal protein L13 (rplM). Analysis of this protein sequence reveals the following:

```
Possible site: 55
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.3426(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

A related GBS nucleic acid sequence <SEQ ID 9507> which encodes amino acid sequence <SEQ ID 9508> was also identified.

The protein has homology with the following sequences in the GENPEPT database:

```

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 171

A DNA sequence (GBSx0177) was identified in *S.agalactiae* <SEQ ID 571> which encodes the amino acid sequence <SEQ ID 572>. This protein is predicted to be 30S ribosomal protein S9 (rpsI). Analysis of this protein sequence reveals the following:

```
Possible site: 53
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.1761(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:CAB11926 GB:Z99104 ribosomal protein S9 [Bacillus subtilis]

SEQ ID 8508 (GBS405) was expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 171 (lane 4; MW 46kDa – 2 bands) and in Figure 177 (lane 7; MW 46kDa). It was also expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 76 (lane 5; MW 21kDa).

GBS405-GST was purified as shown in Figure 218, lane 8.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 180

A DNA sequence (GBSx0186) was identified in *S.agalactiae* <SEQ ID 595> which encodes the amino acid sequence <SEQ ID 596>. Analysis of this protein sequence reveals the following:

```
Possible site: 18
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
                bacterial cytoplasm --- Certainty=0.3406(Affirmative) < succ>
                 bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                  bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 181

A DNA sequence (GBSx0187) was identified in *S.agalactiae* <SEQ ID 599> which encodes the amino acid sequence <SEQ ID 600>. Analysis of this protein sequence reveals the following:

```
Possible site: 42
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.2544(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 182

A DNA sequence (GBSx0188) was identified in *S.agalactiae* <SEQ ID 601> which encodes the amino acid sequence <SEQ ID 602>. Analysis of this protein sequence reveals the following:

```
Possible site: 57
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.2045(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

A related DNA sequence was identified in *S.pyogenes* <SEQ ID 603> which encodes the amino acid sequence <SEQ ID 604>. Analysis of this protein sequence reveals the following:

```
Possible site: 57
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.2045(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

```

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 183

A DNA sequence (GBSx0189) was identified in *S.agalactiae* <SEQ ID 605> which encodes the amino acid sequence <SEQ ID 606>. Analysis of this protein sequence reveals the following:

```
Possible site: 13
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.1621(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

A related DNA sequence was identified in *S.pyogenes* <SEQ ID 607> which encodes the amino acid sequence <SEQ ID 608>. Analysis of this protein sequence reveals the following:

```
Possible site: 22
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.1596(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

An alignment of the GAS and GBS proteins is shown below:

```
 Identities = 91/95 (95%), Positives = 93/95 (97%)

Query: 1  MVTAEKNRAVTFQANKELVSSAMTVLNKKNLTLSSALRLFLQNVVVTNEVDLLTEEELEK 60

           EKLFKQFQABINKNIEDVRQGKFVTSEEVR+ELGL
Sbjct: 61 EKLFKQFQABINKNIEDVRQGKFVTSEEVRAELGL 95
```

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 184

A DNA sequence (GBSx0190) was identified in *S.agalactiae* <SEQ ID 609> which encodes the amino acid sequence <SEQ ID 610>. Analysis of this protein sequence reveals the following:

```
Possible site: 56
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.4568(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

A related GBS nucleic acid sequence <SEQ ID 9513> which encodes amino acid sequence <SEQ ID 9514> was also identified.

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:CAA46375 GB:X65276 ORFA1 [Clostridium acetobutylicum]
 Identities = 36/91 (39%), Positives = 51/91 (55%)

Sbjct: 61 TVVQFENLLESVNQQLNKYADTVAERDAQDA 91
```

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 185

A DNA sequence (GBSx0191) was identified in *S.agalactiae* <SEQ ID 611> which encodes the amino acid sequence <SEQ ID 612>. Analysis of this protein sequence reveals the following:

```
Possible site: 21
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
              bacterial cytoplasm --- Certainty=0.4523(Affirmative) < succ>
               bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 186

A DNA sequence (GBSx0192) was identified in *S.agalactiae* <SEQ ID 613> which encodes the amino acid sequence <SEQ ID 614>. Analysis of this protein sequence reveals the following:

```
Possible site: 44
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
              bacterial cytoplasm --- Certainty=0.5339(Affirmative) < succ>
               bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 187

A DNA sequence (GBSx0193) was identified in *S.agalactiae* <SEQ ID 615> which encodes the amino acid sequence <SEQ ID 616>. This protein is predicted to be chromosome assembly protein. Analysis of this protein sequence reveals the following:

```
Possible site: 61
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
                bacterial cytoplasm --- Certainty=0.4620(Affirmative) < succ>
                 bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                  bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 188

A DNA sequence (GBSx0194) was identified in *S.agalactiae* <SEQ ID 617> which encodes the amino acid sequence <SEQ ID 618>. Analysis of this protein sequence reveals the following:

```
Possible site: 45
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
                bacterial cytoplasm --- Certainty=0.4511(Affirmative) < succ>
                 bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                  bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 189

A DNA sequence (GBSx0195) was identified in *S.agalactiae* <SEQ ID 619> which encodes the amino acid sequence <SEQ ID 620>. Analysis of this protein sequence reveals the following:

```
Possible site: 20
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
                bacterial cytoplasm --- Certainty=0.5249(Affirmative) < succ>
                 bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                  bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 190

A DNA sequence (GBSx0196) was identified in *S.agalactiae* <SEQ ID 621> which encodes the amino acid sequence <SEQ ID 622>. Analysis of this protein sequence reveals the following:

```
Possible site: 14
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.3542(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

A related GBS nucleic acid sequence <SEQ ID 9515> which encodes amino acid sequence <SEQ ID 9516> was also identified.

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 191

A DNA sequence (GBSx0197) was identified in *S.agalactiae* <SEQ ID 623> which encodes the amino acid sequence <SEQ ID 624>. Analysis of this protein sequence reveals the following:

```
Possible site: 15
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.3098(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 192

A DNA sequence (GBSx0198) was identified in *S.agalactiae* <SEQ ID 625> which encodes the amino acid sequence <SEQ ID 626>. This protein is predicted to be rgg protein. Analysis of this protein sequence reveals the following:

```
Possible site: 59
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.3177(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:AAA26968 GB:M89776 rgg [Streptococcus gordonii]
 Identities = 74/277 (26%), Positives = 142/277 (50%)

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 194

A DNA sequence (GBSx0200) was identified in *S.agalactiae* <SEQ ID 633> which encodes the amino acid sequence <SEQ ID 634>. This protein is predicted to be membrane permease OpuCD. Analysis of this protein sequence reveals the following:

```
Possible site: 46
>>> Seems to have an uncleavable N-term signal seq
   INTEGRAL    Likelihood = -5.68   Transmembrane   91 - 107 (  88 - 110)
   INTEGRAL    Likelihood = -4.30   Transmembrane   15 -  31 (   9 -  37)
   INTEGRAL    Likelihood = -3.72   Transmembrane   72 -  88 (  72 -  88)
   INTEGRAL    Likelihood = -3.19   Transmembrane  124 - 140 ( 123 - 142)

----- Final Results -----
                bacterial membrane --- Certainty=0.3272(Affirmative) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

A related GBS nucleic acid sequence <SEQ ID 8509> which encodes amino acid sequence <SEQ ID 8510> was also identified. Analysis of this protein sequence reveals the following:

```
Lipop: Possible site: -1   Crend: 1
McG: Discrim Score:    -10.69
GvH: Signal Score (-7.5): -3.79
     Possible site: 39
>>> Seems to have no N-terminal signal sequence
ALOM program   count: 5 value:  -9.02 threshold:  0.0
   INTEGRAL    Likelihood = -9.02   Transmembrane   35 -  51 (  25 -  53)

SEQ ID 8512 (GBS23) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 14 (lane 8; MW 35kDa).

The GBS23-His fusion product was purified (Figure 194, lane 9) and used to immunise mice. The resulting antiserum was used for Western blot (Figure 251). These tests confirm that the protein is immunoaccessible on GBS bacteria.

Example 196

A DNA sequence (GBSx0202) was identified in *S.agalactiae* <SEQ ID 639> which encodes the amino acid sequence <SEQ ID 640>. This protein is predicted to be membrane permease OpuCB (opuBB). Analysis of this protein sequence reveals the following:

```
Possible site: 34
>>> Seems to have no N-terminal signal sequence
   INTEGRAL     Likelihood = -9.66   Transmembrane   25 -  41 (  18 -  45)
   INTEGRAL     Likelihood = -7.96   Transmembrane  182 - 198 ( 174 - 202)
   INTEGRAL     Likelihood = -4.83   Transmembrane   61 -  77 (  57 -  95)
   INTEGRAL     Likelihood = -4.09   Transmembrane   78 -  94 (  78 -  95)
   INTEGRAL     Likelihood = -1.22   Transmembrane  134 - 150 ( 134 - 150)

----- Final Results -----
              bacterial membrane --- Certainty=0.4864(Affirmative) < Succ>
               bacterial outside --- Certainty=0.0000(Not Clear) < Succ>
             bacterial cytoplasm --- Certainty=0.0000(Not Clear) < Succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 198

A repeated DNA sequence (GBSx0212) was identified in *S.agalactiae* <SEQ ID 645> which encodes the amino acid sequence <SEQ ID 646>. Analysis of this protein sequence reveals the following:

```
Possible site: 24
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.4736(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
```

```
bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 199

A DNA sequence (GBSx0213) was identified in *S.agalactiae* <SEQ ID 647> which encodes the amino acid sequence <SEQ ID 648>. Analysis of this protein sequence reveals the following:

```
Possible site: 38
>>> Seems to have no N-terminal signal sequence
   INTEGRAL    Likelihood = -1.06   Transmembrane   18 -  34 (  18 -  34)

SEQ ID 8516 (GBS389) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 74 (lane 6; MW 18kDa).

The GBS389-His fusion product was purified (Figure 214, lane 4) and used to immunise mice. The resulting antiserum was used for FACS (Figure 313), which confirmed that the protein is immunoaccessible on GBS bacteria.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 200

A DNA sequence (GBSx0214) was identified in *S.agalactiae* <SEQ ID 649> which encodes the amino acid sequence <SEQ ID 650>. Analysis of this protein sequence reveals the following:

```
Possible site: 19
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
              bacterial cytoplasm --- Certainty=0.3766(Affirmative) < succ>
               bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 201

A DNA sequence (GBSx0215) was identified in *S.agalactiae* <SEQ ID 651> which encodes the amino acid sequence <SEQ ID 652>. Analysis of this protein sequence reveals the following:

```
Possible site: 46
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
              bacterial cytoplasm --- Certainty=0.3882(Affirmative) < succ>
               bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 202

A DNA sequence (GBSx0216) was identified in *S.agalactiae* <SEQ ID 653> which encodes the amino acid sequence <SEQ ID 654>. This protein is predicted to be lectin, alpha subunit precursor. Analysis of this protein sequence reveals the following:

```
Possible site: 47
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
                bacterial cytoplasm --- Certainty=0.0653(Affirmative) < succ>
                 bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                  bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT databasc.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 203

A DNA sequence (GBSx0217) was identified in *S.agalactiae* <SEQ ID 655> which encodes the amino acid sequence <SEQ ID 656>. Analysis of this protein sequence reveals the following:

```
Possible site: 41
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
                bacterial cytoplasm --- Certainty=0.6569(Affirmative) < succ>
                 bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                  bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 204

A DNA sequence (GBSx0218) was identified in *S.agalactiae* <SEQ ID 657> which encodes the amino acid sequence <SEQ ID 658>. Analysis of this protein sequence reveals the following:

```
Possible site: 27
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
                bacterial cytoplasm --- Certainty=0.5736(Affirmative) < succ>
                 bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                  bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 205

A DNA sequence (GBSx0219) was identified in *S.agalactiae* <SEQ ID 659> which encodes the amino acid sequence <SEQ ID 660>. Analysis of this protein sequence reveals the following:

```
Possible site: 52
>>> Seems to have an uncleavable N-term signal seq
   INTEGRAL    Likelihood =-13.11   Transmembrane  146 - 162 ( 138 - 170)
   INTEGRAL    Likelihood =-12.90   Transmembrane   13 -  29 (   9 -  32)

----- Final Results -----
               bacterial membrane --- Certainty=0.6243(Affirmative) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>
              bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

A related GBS nucleic acid sequence <SEQ ID 8517> which encodes amino acid sequence <SEQ ID 8518> was also identified.

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 206

A DNA sequence (GBSx0220) was identified in *S.agalactiae* <SEQ ID 661> which encodes the amino acid sequence <SEQ ID 662>. Analysis of this protein sequence reveals the following:

```
Possible site: 37
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
              bacterial cytoplasm --- Certainty=0.2374(Affirmative) < succ>
               bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:AAB89623 GB:AE000990 repressor protein [Archaeoglobus
            fulgidus]
 Identities = 34/62 (54%), Positives = 46/62 (73%)

                bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

A related GBS gene <SEQ ID 8519> and protein <SEQ ID 8520> were also identified. Analysis of this protein sequence reveals the following:

```
Lipop: Possible site: -1   Crend: 10
McG: Discrim Score:     -3.31
GvH: Signal Score (-7.5): -4.44
     Possible site: 39
>>> Seems to have no N-terminal signal sequence
ALOM program   count: 1 value: -12.15 threshold:  0.0
  INTEGRAL   Likelihood = -12.15   Transmembrane   25 -  41 (  20 -  49)
  PERIPHERAL  Likelihood = 11.94      59
 modified ALOM score:   2.93

*** Reasoning Step: 3

----- Final Results -----
               bacterial membrane --- Certainty=0.5861(Affirmative) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>
              bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

SEQ ID 672 (GBS43) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 5 (lane 4; MW 34kDa). It was also expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 13 (lane 9; MW 58kDa) and in Figure 15 (lane 4; MW 59kDa).

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 211

A DNA sequence (GBSx0225) was identified in *S.agalactiae* <SEQ ID 673> which encodes the amino acid sequence <SEQ ID 674>. Analysis of this protein sequence reveals the following:

```
Possible site: 32
>>> May be a lipoprotein

----- Final Results -----
               bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>
              bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

A related GBS nucleic acid sequence <SEQ ID 9519> which encodes amino acid sequence <SEQ ID 9520> was also identified.

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 212

A DNA sequence (GBSx0226) was identified in *S.agalactiae* <SEQ ID 675> which encodes the amino acid sequence <SEQ ID 676>. Analysis of this protein sequence reveals the following:

```
Possible site: 44
>>> Seems to have no N-terminal signal sequence
  INTEGRAL    Likelihood = -1.54   Transmembrane  165 - 181 ( 164 - 181)
  INTEGRAL    Likelihood = -0.85   Transmembrane   67 -  83 (  67 -  84)

----- Final Results -----

SEQ ID 8522 (GBS391) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 74 (lane 7; MW 30kDa). It was also expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 83 (lane 4; MW 55kDa).

GBS391-GST was purified as shown in Figure 217, lane 3.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 216

A DNA sequence (GBSx0230) was identified in *S.agalactiae* <SEQ ID 687> which encodes the amino acid sequence <SEQ ID 688>. Analysis of this protein sequence reveals the following:

```
Possible site: 13
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.6732(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
              bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 217

A repeated DNA sequence (GBSx0231) was identified in *S.agalactiae* <SEQ ID 689> which encodes the amino acid sequence <SEQ ID 690>. This protein is predicted to be ISL2 protein. Analysis of this protein sequence reveals the following:

```
Possible site: 58
>>> Seems to have an uncleavable N-term signal seq

----- Final Results -----
               bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>

Example 220

A DNA sequence (GBSx0234) was identified in *S.agalactiae* <SEQ ID 695> which encodes the amino acid sequence <SEQ ID 696>. This protein is predicted to be minor extracellular protease epr precursor (epr). Analysis of this protein sequence reveals the following:

```
Possible site: 31
>>> Seems to have an uncleavable N-term signal seq
   INTEGRAL    Likelihood =-10.72   Transmembrane   10 -  26 (   5 -  33)

----- Final Results -----
               bacterial membrane --- Certainty=0.5288(Affirmative) < succ>
                bacterial outside --- Certainty=0.0000(Not Clear) < succ>
              bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

A related GBS nucleic acid sequence <SEQ ID 8523> which encodes amino acid sequence <SEQ ID 8524> was also identified. Analysis of this protein sequence reveals the following:

```
Lipop Possible site: -1   Crend: 8
McG: Discrim Score:     12.11
GvH: Signal Score (-7.5): -4.02
     Possible site: 29
>>> Seems to have an uncleavable N-term signal seq
ALOM program   count: 1 value: -10.72 threshold:  0.0
   INTEGRAL    Likelihood =-10.72   Transmembrane   8 -  24 (   5 -  33)
   PERIPHERAL  Likelihood = 13.74     219
 modified ALOM score:   2.64

*** Reasoning Step: 3

----- Final Results -----
                bacterial membrane --- Certainty=0.5288(Affirmative) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
               bacterial cytoplasm --- Certainty=0.0000(Not Clear) < succ>
```

SEQ ID 8524 (GBS278) was expressed in *E.coli* as a His-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 52 (lane 6; MW 40kDa).

The GBS278-His fusion product was purified (Figure 206, lane 10) and used to immunise mice. The resulting antiserum was used for FACS (Figure 305), which confirmed that the protein is immunoaccessible on GBS bacteria.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 221

A DNA sequence (GBSx0235) was identified in *S.agalactiae* <SEQ ID 699> which encodes the amino acid sequence <SEQ ID 700>. Analysis of this protein sequence reveals the following:

```
Possible site: 53
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
            bacterial cytoplasm --- Certainty=0.1466(Affirmative) < succ>
             bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
```

```
bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has no significant homology with any sequences in the GENPEPT database.

No corresponding DNA sequence was identified in *S.pyogenes*.

Based on this analysis, it was predicted that this protein and its epitopes, could be useful antigens for vaccines or diagnostics.

Example 222

A DNA sequence (GBSx0236) was identified in *S.agalactiae* <SEQ ID 701> which encodes the amino acid sequence <SEQ ID 702>. This protein is predicted to be N-acetylglucosamine-6-phosphate deacetylase (nagA). Analysis of this protein sequence reveals the following:

```
Possible site: 15
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
               bacterial cytoplasm --- Certainty=0.4607(Affirmative) < succ>
                bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                 bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

A related GBS nucleic acid sequence <SEQ ID 9297> which encodes amino acid sequence <SEQ ID 9298> was also identified.

The protein has homology with the following sequences in the GENPEPT database:

```

SEQ ID 714 (GBS422) was expressed in *E.coli* as a GST-fusion product. SDS-PAGE analysis of total cell extract is shown in Figure 172 (lane 7; MW 60kDa).

GBS422-GST was purified as shown in Figure 219, lane 12.

Based on this analysis, it was predicted that these proteins and their epitopes could be useful antigens for vaccines or diagnostics.

Example 226

A DNA sequence (GBSx0240) was identified in *S.agalactiae* <SEQ ID 717> which encodes the amino acid sequence <SEQ ID 718>. Analysis of this protein sequence reveals the following:

```
Possible site: 45
>>> Seems to have no N-terminal signal sequence

----- Final Results -----

----- Final Results -----
                bacterial cytoplasm --- Certainty=0.3614(Affirmative) < succ>
                 bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                  bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

The protein has homology with the following sequences in the GENPEPT database:

```
>GP:BAB04556 GB:AP001510 unknown conserved protein [Bacillus halodurans]
 Identities = 60/189 (31%), Positives = 102/189 (53%), Gaps = 3/189 (1%)

A related DNA sequence was identified in *S.pyogenes* <SEQ ID 731> which encodes the amino acid sequence <SEQ ID 732>. Analysis of this protein sequence reveals the following:

```
Possible site: 30
>>> Seems to have no N-terminal signal sequence

----- Final Results -----
                bacterial cytoplasm --- Certainty=0.1864(Affirmative) < succ>
                 bacterial membrane --- Certainty=0.0000(Not Clear) < succ>
                  bacterial outside --- Certainty=0.0000(Not Clear) < succ>
```

An alignment of the GAS and GBS proteins is shown below:
